IDAHO PUBLIC
UTILITIES COMMISSION

BEFORE THE IDAHO PUBLIC UTILITIES COMMISSION

IN THE MATTER OF IDAHO POWER)
COMPANY'S APPLICATION FOR) CASE NO. IPC-E-16-14
APPROVAL OF NEW TARIFF SCHEDULE)
63, A COMMUNITY SOLAR PILOT)
PROGRAM.)
_____)

IDAHO POWER COMPANY

DIRECT TESTIMONY

OF

DAVID M. ANGELL

1 Q. Please state your name and business address.

2 A. My name is Dave Angell. My business address
3 is 1221 West Idaho Street, Boise, Idaho.

4 Q. By whom are you employed and in what capacity?

5 A. I am employed by Idaho Power Company ("Idaho
6 Power" or "Company") as the Planning Manager in the
7 Customer Operations Engineering and Construction
8 Department.

9 Q. Please describe your educational background.

10 A. I graduated in 1984 and 1986 from the
11 University of Idaho, Moscow, Idaho, receiving a Bachelor of
12 Science Degree and Master of Engineering Degree in
13 Electrical Engineering, respectively. I have provided
14 electrical engineering instruction for both the University
15 of Idaho and Boise State University. Most recently I
16 instructed power system analysis at Boise State University
17 during the 2009 spring semester.

18 Q. Please describe your work experience with
19 Idaho Power.

20 A. From 1986 to 1996, I was employed by Idaho
21 Power as an engineer in both communications and protection
22 systems. In 1996, I became the Engineering Leader of
23 System Protection and Communications. I held this position
24 until 2004, when I transferred to Transmission and
25 Distribution Planning. During the fall of 2006, I accepted

1 the positions of System Planning Leader and Manager of
2 Delivery Planning. I have been managing Idaho Power's load
3 research, interconnected-transmission system, sub-
4 transmission, and distribution planning since 2006.

5 Q. What is the purpose of your testimony in this
6 proceeding?

7 A. The purpose of my testimony is to describe the
8 construction and operational aspects of the Company's
9 proposed Community Solar Pilot Program ("Program").

10 Q. How is your testimony organized?

11 A. My testimony is organized as follows:

12 (1) I provide an overview of the project and the
13 selected location.

14 (2) I discuss the request for bid ("RFB") issued
15 for the construction of the solar array and
16 the results.

17 (3) I describe the interconnection process and
18 cost to connect the solar array to Idaho
19 Power's grid.

20 (4) I discuss the expected energy production of
21 the facility and the line losses applied to
22 that energy.

23 (5) I describe the operational benefits and the
24 operational learning objectives of the
25 Program.

1 **I. Community Solar Project Overview**

2 Q. Please summarize the proposed project.

3 A. The Company is proposing to build a 500
4 kilowatt ("kW") single-axis tracking solar array in
5 southeast Boise that will offer Idaho Power customers in
6 Idaho the opportunity to buy electricity from a local solar
7 array. Based on the current timeline and contingent upon
8 Commission approval, the Company plans to have the facility
9 built and operational no later than June of 2017.

10 Q. Why did the Company choose to build the Solar
11 array in Boise?

12 A. The Company considered multiple locations
13 around its service territory and evaluated each site based
14 on price, current infrastructure, permitting,
15 constructability, access, and general impacts. Ultimately,
16 the land adjacent to Idaho Power's Boise Bench substation
17 was chosen to be most suitable for the pilot project.

18 Q. What factors drove the decision to build at
19 the Boise Bench substation?

20 A. The Company evaluated each location based on
21 the factors described above to determine which location
22 would result in the lowest cost imposed upon the project.
23 The location adjacent to the Boise Bench substation is
24 owned by the Company, is fairly flat, has limited potential
25 for other use, is zoned for industrial, is in close

1 proximity to the engineering staff, and is adjacent to two
2 distribution circuits for interconnection and a substation
3 with significant communications infrastructure. This
4 location minimizes the project cost by eliminating a land
5 purchase and grading, has reduced permit requirements,
6 requires minimal distribution circuit upgrades, and
7 minimizes engineer and technician travel and communications
8 infrastructure.

9 Q. What permits are required for the construction
10 of this solar array?

11 A. Idaho Power will be responsible for securing
12 the following permits: (1) Federal Aviation Administration
13 ("FAA") written approval regarding potential reflectivity
14 and (2) a Boise City Conditional Use Permit. The FAA
15 application is currently pending. The Company will file
16 for the Conditional Use Permit through the City of Boise.

17 The selected contractor has discussed permitting
18 requirements with the City of Boise and they believe that
19 they will need the following permits: (1) Boise City
20 Building Permit, Solar, for projects greater than \$100,000
21 and 2) Boise City Electrical Permit, Solar, wiring cost
22 greater than \$10,000.

23 **II. RFB Process and Results**

24 Q. Please give a high-level overview of the
25 Company's RFB process.

1 A. On February 1, 2016, the Company sent an RFB
2 to a selection of 12 potential bidders for the design,
3 procurement, and construction of a 500 kW single-axis
4 tracking solar photovoltaic PV system to be built in Boise,
5 Idaho on land owned by Idaho Power. The RFB included
6 detailed technical specifications and special conditions
7 that each bidder had to incorporate into their bid
8 proposal. The Company also requested that the respondents
9 provide two bid alternates along with their base bid. The
10 Company's first alternate bid was for the design,
11 procurement, and construction of a 500 kW fixed-panel
12 system. The second alternate bid was for a full site build
13 out of the base bid.

14 Q. How did the Company select the 12 bidders for
15 the RFB?

16 A. The Company began compiling a list of
17 contractors and solar PV installers by consulting with
18 Idaho Power employees who had relevant in-field experience.
19 The Company also included one bidder because of awareness
20 through their participation in Idaho Power's long-term
21 planning process. The Company then verified that all of
22 the companies on the list were either Idaho based, or had
23 an Idaho presence. The 12 companies that received the RFB
24 met this condition.

25 Q. What were the results of the RFB?

1 A. Idaho Power held a mandatory pre-bid meeting
2 on February 18, 2016, in which nine of the 12 bidders
3 attended. The RFB bids were due on March 16, 2016. Of the
4 nine eligible bidders, the Company received a total of five
5 bids, however, only four of those bids were deemed complete
6 according to the specifications in the RFB documents.

7 Q. How was the successful contractor chosen?

8 A. Following the issuance of the RFB, an internal
9 team conducted a thorough evaluation of each of the bids.
10 The team specifically reviewed the proposed equipment to
11 ensure it conformed to Idaho Power's technical
12 specifications. Next, the team analyzed each bid based
13 upon energy cost and a risk assessment of each company to
14 determine which bid resulted in the least-cost and least-
15 risk to Idaho Power, shareholders, and customers.

16 Q. What is the cost of the solar array?

17 A. The cost estimate provided by the selected
18 contractor is \$1,158,769.

19 Q. Generally describe the equipment to be
20 installed at the site.

21 A. Based upon the technical specifications in the
22 RFB, the successful contractor has proposed to install
23 1,800 Hanwha Q-cells 320 watt solar modules mounted on
24 Array Technologies single-axis tracking mount. The Hanwha
25 Q-cells are German-engineered 72-cell solar panels which

1 have won a number of performance competitions in real world
2 testing for kilowatt-hour ("kWh") generation versus
3 capacity installed. Array Technologies is the industry
4 leader in small to large utility scale tracked mounting
5 systems. According to the manufacturer, the system
6 requires zero scheduled maintenance. The selected
7 contractor has proposed to use SolarEdge SE33.3k-US
8 inverters for the project. The SolarEdge system utilizes
9 power optimizers for every pair of modules in the array.
10 This allows each module in the array to perform
11 efficiently. Any shade impacts or soiling between modules
12 are limited to only the modules directly affected.
13 According to the information provided by the selected
14 contractor, another advantage of the SolarEdge system is
15 that they require less wiring compared to string inverters
16 which reduces wire losses within the array. The inverters
17 come standard with a 12-year warranty. The optimizers
18 allow for module-level monitoring. This simplifies
19 operations and maintenance expense by pinpointing any
20 trouble spots and allows for confirmation at a glance that
21 the array is performing to full expectations. Module-level
22 monitoring can reduce costly maintenance work by displaying
23 the exact location of a failure in real-time.

24 Q. Has the Company issued a notice to proceed to
25 the selected contractor?

1 A. No. The Company will not issue a notice to
2 proceed until the Company receives an Idaho Public
3 Utilities Commission ("Commission") order approving the
4 pilot Program, as well as sufficient program enrollment.
5 In his testimony, Mr. Pengilly discusses the conditions
6 upon which the Company will proceed with the project.

7 Q. When does the Company anticipate commercial
8 operation of the community solar project?

9 A. In the RFB, the Company requested that
10 substantial completion of the project occur by May 24, 2017
11 with a final completion date of June 7, 2017. As
12 indicated above, the Company will not issue a notice to
13 proceed prior to receiving a Commission order; the date of
14 such order may impact the completion dates identified in
15 the RFB.

16 **III. Interconnection**

17 Q. Please describe the interconnection process.

18 A. Every generation facility that wants to
19 connect to Idaho Power's system must submit an
20 interconnection request consistent with Idaho Power's Open
21 Access Transmission Tariff filed with the Federal Energy
22 Regulatory Commission. The request is studied to determine
23 what, if any, facilities are reasonably required by good
24 utility practices and the National Electric Safety Code to

1 interconnect and allow the delivery of energy from the
2 generation facility to the Company's system.

3 Q. Did the proposed solar array have to go
4 through the interconnection process?

5 A. Yes. Even though the proposed project will be
6 an Idaho Power-owned resource, the Company had to follow
7 the required steps for the interconnection process.

8 Q. What were the Facility Study results for the
9 interconnection of the proposed solar array?

10 A. On April 21, 2016, the Facility Study was
11 completed and the preliminary costs for interconnecting the
12 community solar array are approximately \$81,000.

13 Q. Are the interconnection costs included in the
14 total project costs?

15 A. Yes. These costs are included in the total
16 project costs used to calculate the Program Subscription
17 Fee detailed in the testimony of Company witness Mr.
18 Larkin.

19 **IV. Expected Solar Energy Production**

20 Q. How was the expected energy production for the
21 project determined?

22 A. As part of the RFB, the Company requested that
23 each respondent provide the monthly energy output estimate
24 for the Typical Meteorological Year 3 ("TMY3" - an hourly
25 meteorological data set that has natural diurnal and

1 seasonal variations and represent a year of typical
2 climatic conditions for a location over a long period of
3 time) for the first 20¹ years for each option proposed. The
4 energy output estimate shall take into account single
5 access tracking or fixed panel, inter-row shading,
6 available insolation at the project site, typical weather
7 at project site, typical PV panel degradation, inverter
8 conversion efficiency, wiring losses, soiling losses, and
9 mismatch losses.

10 Q. What is the expected energy production for the
11 project based upon the criteria mentioned above?

12 A. The average annual energy output provided by
13 the selected contractor is 1,031,000 kWh per year for 20
14 years. The annual output includes a stated performance
15 degradation of 0.6 percent.

16 Q. How did the Company verify that the estimated
17 production was reasonable for the selected location?

18 A. The Company simulated the energy production
19 using National Renewable Energy Laboratory's ("NREL")
20 PVWatts® Calculator and NREL's System Advisor Model
21 ("SAM"). Both programs are available on NREL's website and
22 are widely used by homeowners, small building owners,

¹ Information requested in the RFB was based upon the premise of a 20-year Program term. Subsequently, the Company revised the term to 25 years based on customer feedback.

1 installers, and manufacturers to estimate the performance
2 of potential PV installations.

3 Q. Does the estimate of annual energy production
4 from the selected contractor include line losses?

5 A. No. The energy provided as part of the RFB is
6 considered generation-level energy.

7 Q. Should line losses be included in the energy
8 production estimate for programmatic purposes?

9 A. Yes.

10 Q. Please explain why they should be included.

11 A. A portion of the line losses should be
12 included in the annual energy production to account for the
13 delivery of the energy from the production location to the
14 community solar subscriber. The Company determined that
15 the typical transmission, substation, and primary
16 distribution losses would be offset as the actual energy
17 would be consumed by customers on the distribution feeder
18 in close proximity to the 500 kW community solar project.
19 However, the distribution secondary losses of 3.3 percent
20 will not be offset by the local energy production and will
21 be included in the Program.

22 Q. Please explain how the line losses will be
23 included as part of the Program.

24 A. As detailed in the testimony of Company
25 witness Mr. Pengilly, each program participant will receive

1 their proportionate share of the total energy based on
2 their level of subscription. On a monthly basis the
3 project's total energy, as measured at the meter, will be
4 reduced by the line loss percent discussed above. The
5 resulting energy total also referred to as customer-level
6 energy will be divided among the Program participants
7 commensurate with their level of subscription.

8 Q. What is the average annual energy based on
9 expected annual output including line losses?

10 A. Applying the line losses discussed above of
11 3.3 percent to the average annual output of 1,031,000 kWh
12 results in 996,977 kWh per year.

13 **V. Operational Learning Objectives of the Pilot Program**

14 Q. What operational knowledge is to be gained by
15 offering the Community Solar Pilot Program as a pilot?

16 A. The Company intends for this initial offering
17 to be treated as a pilot program for a variety of
18 operational reasons. The Company expects to gain experience
19 with the following:

20 1. The power output of a single-axis PV solar
21 facility at the time of the feeder customers' coincident
22 peak demand. This will supplement the prior investigation
23 of the effects of solar intensity variations on
24 distribution feeder load and allow the Company to

25

1 incorporate an appropriate on peak capacity factor in its
2 long-term capacity planning processes.

3 2. The control of the inverter. The Company has
4 specified the installation of a four quadrant remotely
5 configurable inverter, also known as a smart inverter. The
6 Company needs this experience in advance of integrating
7 many solar PV facilities on the distribution system to
8 avoid the voltage management issues that other electric
9 utilities have experienced. Thus, the inverter will be
10 configured to aid with voltage management of the
11 distribution feeder.

12 3. The monitoring requirements of PV solar and
13 how best to present the information to the Company's plant
14 dispatch and technician personnel.

15 4. The maintenance and failure rates of PV solar
16 equipment, especially the single-axis tracking system, in
17 order to determine staffing and response requirements.

18 5. The various facility issues that may cause PV
19 solar facilities to underperform. This will allow the
20 Company to incorporate an appropriate factor in its long-
21 term planning process.

22 **VI. Conclusion**

23 Q. Please summarize your testimony.

24 A. The Company is proposing to build a 500 kW
25 single-axis tracking solar array at the Boise Bench

1 substation. The project will offer Idaho Power customers
2 in Idaho the opportunity to buy electricity from a local
3 solar array. The Company submitted an RFB to determine the
4 cost to build the array. The selected contractor was the
5 least-cost and least-risk bid of those submitted. The
6 pilot nature of the Program will allow the Company to gain
7 operational experience with this kind of generation
8 facility. The Company's anticipated operation date,
9 contingent upon Commission approval, is June 2017.

10 Q. Does this conclude your testimony?

11 A. Yes.

ATTESTATION OF TESTIMONY

STATE OF IDAHO)
) ss.
County of Ada)

I, David M. Angell, having been duly sworn to testify truthfully, and based upon my personal knowledge, state the following:

I am employed by Idaho Power Company as the Planning Manager in the Customer Operations Engineering and Construction Department and am competent to be a witness in this proceeding.

I declare under penalty of perjury of the laws of the state of Idaho that the foregoing pre-filed testimony and exhibits are true and correct to the best of my information and belief.

DATED this 22nd day of June, 2016.

David M. Angell

SUBSCRIBED AND SWORN to before me this 22nd day of June, 2016.

**JENNIFER MAGELKY-SEILER
NOTARY PUBLIC
STATE OF IDAHO**

Notary Public for Idaho
Residing at: *Latah*
My commission expires:
5/7/2021
