Re: Case No. IPC-E-19-18
Validation of North Valmy Power Plant Unit 2 Closure in 2025
Idaho Power Company's Testimony

Dear Ms. Hanian:

Attached for electronic filing in the above matter is Idaho Power Company's Supplemental Direct Testimony of Tom Harvey.

If you have any questions about the enclosed documents, please do not hesitate to contact me.

Very truly yours,

A handwritten signature in cursive script that reads "Lisa D. Nordstrom".

Lisa D. Nordstrom

Enclosures

BEFORE THE IDAHO PUBLIC UTILITIES COMMISSION

IN THE MATTER OF IDAHO POWER)
COMPANY'S APPLICATION FOR A) CASE NO. IPC-E-19-18
DETERMINATION VALIDATING A NORTH)
VALMY POWER PLANT UNIT 2 CLOSURE)
IN 2025.)
_____)

IDAHO POWER COMPANY
SUPPLEMENTAL DIRECT TESTIMONY
OF
TOM HARVEY

1 Q. Please state your name, business address, and
2 present position with Idaho Power Company ("Idaho Power" or
3 "Company").

4 A. My name is Tom Harvey and my business address
5 is 1221 West Idaho Street, Boise, Idaho 83702. I am
6 employed by Idaho Power as the Vice President of Power
7 Supply in the Power Supply Department.

8 Q. Have you previously submitted testimony before
9 the Idaho Public Utilities Commission ("Commission") in
10 this proceeding?

11 A. Yes. On June 27, 2019, I filed testimony
12 presenting the results of the Valmy Unit 2 closure analyses
13 supporting a December 31, 2025, end-of-life date and
14 requesting the Commission acknowledge the Company has
15 sufficiently validated the economic retirement date of Unit
16 2 is December 31, 2025, as directed by the Commission in
17 Order No. 34349.

18 Q. What is the purpose of your testimony in this
19 case?

20 A. The purpose of my testimony is to present
21 additional validation that the economic retirement date of
22 Valmy Unit 2 is December 31, 2025, based on the analyses
23 performed during and after the development of the Amended
24 2019 Integrated Resource Plan ("IRP") filed with the
25 Commission on January 31, 2020, as directed by the

1 Commission in Order No. 34349. The additional analyses
2 performed using the results of the Amended 2019 IRP
3 validate the conclusions found in the initial analysis
4 presented in my direct testimony. The results indicate
5 that, under the broad range of modeled scenarios, an exit
6 from Unit 2 prior to 2025 would result in higher costs for
7 customers and would cause system reliability concerns. The
8 analyses validate year-end 2025 as the appropriate end-of-
9 life date for Valmy Unit 2.

10 Q. Do you have any exhibits?

11 A. Yes. Exhibit No. 1 to my testimony presents
12 the net present value ("NPV") difference between the cost
13 of the Preferred Portfolio and the portfolios modeled
14 during the Company's supplemental analyses discussed later
15 in my testimony. Exhibit No. 2 illustrates the results of
16 the Frequency Duration Loss of Load evaluation performed.

17 **I. THE AMENDED 2019 IRP**

18 Q. Please describe what led to the filing of the
19 Amended 2019 IRP.

20 A. As mentioned in my direct testimony filed in
21 June 2019, Idaho Power used the Long-Term Capacity
22 Expansion ("LTCE") modeling capability of AURORA to produce
23 Western Electricity Coordinating Council- ("WECC")
24 optimized portfolios under various future conditions.
25 Specifically, the AURORA LTCE modeling was performed using

1 three natural gas forecasts and four carbon emissions
2 adders, with the Boardman-to-Hemingway transmission line
3 project ("B2H") and without.

4 The result was 24 separate portfolios, all with a
5 Valmy Unit 2 shutdown date of 2025, that included varied
6 amounts of nameplate generation additions, creating a
7 diversity of resource mixes. While retiring Valmy Unit 2
8 prior to 2025 was an option available for selection within
9 the logic of the LTCE model, none of the 24 portfolios
10 included an early retirement of this unit. When analyzing
11 the portfolio results as part of a different case filed by
12 the Company, Idaho Power discovered an issue within the
13 logic of the LTCE modeling in AURORA that warranted further
14 investigation.

15 Q. What concerns did the Company have with the
16 logic built into the LTCE modeling of AURORA?

17 A. It was determined that while optimizing
18 resource build-out portfolios for the WECC region, of which
19 Idaho Power's balancing authority is part, AURORA appeared
20 to be modifying the resource timing of the Company's
21 resources to the benefit of the WECC. While optimizing and
22 reducing costs for the WECC region, the Company was
23 concerned that the results did not reflect the least cost
24 portfolio for Idaho Power and its customers.

1 Q. How did the Company address this issue with
2 the LTCE modeling logic?

3 A. To ensure the final preferred portfolio was
4 optimized for Idaho Power, the Company manually modified a
5 subset of the top-performing WECC-optimized portfolios to
6 arrive at the least-cost, least risk portfolio specific to
7 Idaho Power. Through this process, the annual level of
8 reserves on the system was evaluated and resource additions
9 and retirements were modified to determine if a more
10 economically optimal result could be achieved. Extra
11 attention was given to the Jim Bridger Coal Plant
12 ("Bridger") to ensure the shutdown dates of these units
13 were developed to yield the best possible economic and
14 reliability outcome for the Company and its customers.

15 **II. SUPPLEMENTAL VALMY UNIT 2 CLOSURE ANALYSES**

16 Q. Did the manual modification result in any
17 changes to the Valmy Unit 2 shutdown date of 2025?

18 A. No. The logic of the capacity expansion model
19 allowed Unit 2 to retire in 2025 or earlier. In all 24
20 LTCE scenarios, Unit 2 did not shut down prior to 2025. In
21 fact, the manual modification resulted in only two changes
22 to Idaho Power's preferred portfolio: the removal of a
23 solar resource no longer available and the shift of demand
24 response procurement to later in the planning period. There
25 were no changes associated with any coal-fired generating

1 units within the action plan window; the portfolios
2 continue to indicate favorable economics associated with
3 the exit of five of seven units by 2026.

4 Q. Did the Company perform any additional
5 analyses of the portfolio results to further validate the
6 Unit 2 2025 shutdown date?

7 A. Yes. Given the concerns around the LTCE
8 model's ability to fully optimize for Idaho Power's
9 specific system, additional analysis was performed to
10 further validate that year-end 2025 is the optimal exit
11 date from Valmy Unit 2 for Idaho Power and its customers.
12 To accomplish this, Idaho Power performed a comprehensive
13 analysis¹ to further validate the Unit 2 2025 shutdown date,
14 comparing the NPV differences between the portfolio costs
15 of the amended IRP portfolios with a series of alternative
16 futures, including:

- 17 • a Valmy Unit 2 shutdown of 2024 under planning
18 natural gas and planning CO2 cost assumptions,
- 19 • a Valmy Unit 2 shutdown of 2023 under planning
20 natural gas and planning CO2 cost assumptions,

¹ The analysis presented in this testimony was initially performed in response to discovery from Commission Staff ("Staff") issued in this case. Therefore, the figures presented herein reflect those provided to parties through the discovery process.

1 Margin), is used to ensure reliable system operation in the
2 future and is intended to account for NERC reliability
3 requirements², load variability and loss of system elements
4 that may reduce the capability of existing generation
5 resources to serve demand.

6 Q. You mentioned earlier that the IRP analyzed
7 three different gas price forecasts and four potential
8 carbon adders. Why did the Company only analyze a subset of
9 these futures in the current analysis?

10 A. The subset of future scenarios modeled in this
11 case appropriately tests the viability of earlier shutdown
12 dates for Valmy Unit 2 because the scenarios apply
13 conditions under which it would be most beneficial to
14 accelerate the retirement of a coal unit, i.e. scenarios in
15 which the cost of a different fuel (natural gas) is low,
16 and the cost of running coal facilities is highest due to
17 the high CO2 cost assumptions. Therefore, if it is not
18 beneficial to accelerate the exit from Valmy Unit 2 under
19 these scenarios, it is highly unlikely that a different
20 modeled future would yield a different result.

21 Q. What is the NPV difference between the cost of
22 the Preferred Portfolio and the portfolios under planning
23 natural gas and planning CO2 cost assumptions and with B2H?

² BAL-002-WECC-1

1 A. As can be seen on Line 1 of Exhibit No. 1, the
2 NPV of the Preferred Portfolio is \$758,000 less than the
3 NPV of a portfolio using a Valmy Unit 2 shutdown of 2024
4 and \$1,016,000 less than a portfolio using a Valmy Unit 2
5 shutdown of 2023 under planning natural gas and planning
6 CO2 assumptions and including B2H.

7 Q. What is the NPV difference between the cost of
8 the Preferred Portfolio and the portfolios under planning
9 natural gas and high CO2 cost assumptions and with B2H?

10 A. The NPV of the Preferred Portfolio is
11 \$1,107,000 less than the NPV of a portfolio using a Valmy
12 Unit 2 shutdown of 2024 and \$724,000 less than a portfolio
13 using a Valmy Unit 2 shutdown of 2023 under planning
14 natural gas and high CO2 assumptions and including B2H.
15 These results can be found on Line 2 of Exhibit No. 1.

16 Q. Excluding B2H, what is the NPV difference
17 between the cost of the Preferred Portfolio and the
18 portfolios under planning natural gas and planning CO2 cost
19 assumptions?

20 A. The NPV of the Preferred Portfolio is \$941,000
21 less than the NPV of a portfolio using a Valmy Unit 2
22 shutdown of 2024 under planning natural gas and planning
23 CO2 assumptions but without B2H, while the NPV of the
24 Preferred Portfolio is \$638,000 greater than a portfolio
25 using a Valmy Unit 2 shutdown of 2023, as presented on Line

1 3 of Exhibit No. 1. It should be noted, however, that the
2 cost of mitigating the reliability violations created by
3 the shutdown of Unit 2 in 2023 under this scenario totaled
4 approximately \$40 million under the planning gas, planning
5 carbon scenario, as detailed later in my testimony.

6 Q. Excluding B2H, what is the NPV difference
7 between the cost of the Preferred Portfolio and the
8 portfolios under planning natural gas and high CO2 cost
9 assumptions?

10 A. The NPV of the Preferred Portfolio is
11 \$1,103,000 less than the NPV of a portfolio using a Valmy
12 Unit 2 shutdown of 2024 and \$223,000 less than a portfolio
13 using a Valmy Unit 2 shutdown of 2023 under planning
14 natural gas and high CO2 assumptions but excluding B2H.
15 Please see Exhibit No. 1, Line 4 for the detailed results.

16 Q. You indicated that in all scenarios the early
17 exit from Valmy Unit 2 resulted in reliability violations
18 in at least one year prior to 2025 without the available
19 capacity from Unit 2. What was the resulting impact to the
20 planning margin?

21 A. In all eight of the scenarios described
22 earlier and performed as part of the comprehensive LTCE
23 analysis, a planning margin shortfall occurred in either
24 2024 or 2025. A drop below the 15 percent planning margin

1 results in the need to delay the exit of a Bridger coal
2 unit or accelerate the need for another resource.

3 Q. Did Idaho Power perform any further analysis
4 to address the planning margin shortfall?

5 A. Yes. Idaho Power performed an additional
6 analysis to ensure that a more optimal result could not be
7 attained by accelerating the shutdown of Valmy Unit 2 and
8 addressing the resulting planning margin shortfall with a
9 different resource decision.

10 Q. Please describe this analysis.

11 A. The Company utilized a delay in the exit of a
12 Bridger coal unit to address the planning shortfall created
13 by the early exit of Valmy Unit 2 prior to 2025. Because
14 the reliability violations occurred prior to 2026, Idaho
15 Power did not differentiate between the scenarios that
16 included B2H and those that do not, as the modeling changes
17 specific to the timing differences associated with exiting
18 from Valmy Unit 2 prior to 2025 and delaying the first
19 Bridger unit exit are captured prior to the in-service date
20 of B2H.

21 Q. What were the results of the reliability
22 mitigation analysis?

23 A. The results of the reliability mitigation
24 analysis are presented on Lines 5 and 6 of Exhibit No. 1.
25 As can be seen, a delay in the exit of a Bridger coal unit

1 to accelerate the exit of Valmy Unit 2 resulted in
2 significantly higher portfolio costs. The NPV of the
3 Preferred Portfolio is \$29.22 million less than the NPV of
4 a portfolio using a Valmy Unit 2 shutdown of 2024 and
5 \$29.43 million less than a portfolio using a Valmy Unit 2
6 shutdown of 2023 under planning natural gas and planning
7 CO2 cost assumptions. Under planning natural gas and high
8 CO2 cost assumptions, the NPV of the Preferred Portfolio is
9 \$26.24 million less than the NPV of a portfolio using a
10 Valmy Unit 2 shutdown of 2024 and \$25.44 million less than
11 a portfolio using a Valmy Unit 2 shutdown of 2023.

12 Q. Did the Company evaluate the construction of
13 another resource rather than the delay of a Bridger unit
14 exit to mitigate the reliability issues caused by an early
15 Valmy Unit 2 exit?

16 A. Yes. However, because the planning margin
17 shortfall occurs as early as 2024, resource procurement
18 rules and construction timeframes would prevent the
19 addition of any supply-side resources in that amount of
20 time. A movement in the exit date from a Bridger unit is
21 the next best option for meeting load if Valmy Unit 2 was
22 shutdown prior to 2025.

23 Q. To what resource procurement rules is Idaho
24 Power subject?

1 A. Under the Oregon rules governing Resource
2 Procurement for Electric Utilities, which are applicable to
3 Idaho Power in its Idaho jurisdiction, the Company
4 estimates that the entire process to procure and construct
5 additional generation would take a minimum of approximately
6 6 years. In Case No. IPC-E-10-03, the Idaho Commission
7 directed Idaho Power in Order No. 32745 to comply with
8 resource procurement rules applicable in its Oregon service
9 area, "should the Company commence an RFP process for a new
10 supply-side resource prior to the development of Idaho-
11 specific RFP guidelines." These rules would hinder the
12 Company's ability to have available a supply-side resource
13 prior to 2024. Consequently, the Company does not believe
14 acquisition of an additional supply-side resource is a
15 practical option given the timing of the resource
16 deficiency.

17 Q. Did the Company consider demand response as a
18 viable option for mitigating the reliability impacts of an
19 early Valmy Unit 2 shutdown?

20 A. Demand response is considered a resource that
21 is able to meet peak demand and, as such, is factored into
22 Idaho Power's 15 percent peak planning margin. However,
23 demand response is not a resource able to broadly address
24 reliability constraints or reserve requirements.
25 Contingency events can occur any time throughout the year.

1 The 390 MW of demand response on Idaho Power's system is
2 only available in the summer during specific hours.

3 Q. How did the Company determine specifically
4 when the reserve margin deficits occurred?

5 A. Idaho Power performed a Frequency Duration
6 Loss of Load evaluation to determine when resources are
7 required to address reserve margin deficits. The evaluation
8 included 100 iterations of the year 2025 from the preferred
9 portfolio with a Valmy Unit 2 exit modeled in 2023. The
10 results are included as Exhibit No. 2 to my testimony with
11 the hours in which current demand response programs are
12 available shaded. As can be seen, a large number of the
13 loss of load events occur during non-peak hours for which
14 current demand response programs are unavailable.

15 Q. Please summarize the results of the additional
16 validation performed by the Company that the economic
17 retirement date of Valmy Unit 2 is December 31, 2025.

18 A. The additional comprehensive analysis
19 performed by Idaho Power to validate the Unit 2 shutdown
20 date compared the net present value differences between the
21 portfolio costs of the amended IRP portfolios with a series
22 of alternative futures, and further resolved any planning
23 margin shortfalls created by a shutdown of Valmy Unit 2
24 before 2025 by delaying the exit of a Bridger unit. Under
25 seven of the eight scenarios, the Preferred Portfolio

1 reflected a lower NPV than the portfolios with the exit of
2 Valmy Unit 2 prior to 2025. In addition, in all eight
3 scenarios, the early exit from Valmy Unit 2 resulted in
4 reliability violations without available capacity from Unit
5 2. Lastly, delaying the exit of a Bridger unit to meet the
6 planning margin shortfalls resulted in significantly higher
7 portfolio costs than the Preferred Portfolio.

8 **III. CONCLUSION**

9 Q. What conclusions can be drawn from these
10 results?

11 A. As directed by the Commission in Order No.
12 34349, Idaho Power performed Unit 2 closure analyses as
13 part of the 2019 IRP process. The additional analyses
14 performed using the results of the Amended 2019 IRP
15 validate the conclusions found in the initial analysis
16 presented in my direct testimony. The results indicate
17 that, under the broad range of modeled scenarios, an exit
18 from Unit 2 prior to 2025 would result in higher costs for
19 customers and would cause system reliability concerns. The
20 analyses validate year-end 2025 as the appropriate end-of-
21 life date for Valmy Unit 2.

22 Q. Does this complete your testimony?

23 A. Yes, it does.

DECLARATION OF TOM HARVEY

I, Tom Harvey, declare under penalty of perjury under the laws of the state of Idaho:

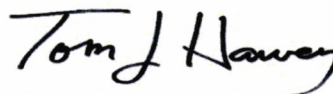

1. My name is Tom Harvey. I am employed by Idaho Power Company as the Vice President of Power Supply in the Power Supply Department.

2. On behalf of Idaho Power, I present this pre-filed supplemental direct testimony and Exhibit Nos. 1-2 in this matter.

3. To the best of my knowledge, my pre-filed supplemental direct testimony and exhibits are true and accurate.

I hereby declare that the above statement is true to the best of my knowledge and belief, and that I understand it is made for use as evidence before the Idaho Public Utilities Commission and is subject to penalty for perjury.

SIGNED this 22nd day of May 2020, at Boise, Idaho.

Tom J. Harvey
