

BEFORE THE IDAHO PUBLIC UTILITIES COMMISSION

IN THE MATTER OF THE APPLICATION )  
OF IDAHO POWER COMPANY FOR ) CASE NO. IPC-E-23-11  
AUTHORITY TO INCREASE ITS RATES )  
AND CHARGES FOR ELECTRIC SERVICE )  
IN THE STATE OF IDAHO AND FOR )  
ASSOCIATED REGULATORY ACCOUNTING )  
TREATMENT. )  
\_\_\_\_\_ )

IDAHO POWER COMPANY

DIRECT TESTIMONY

OF

PAWEL P. GORALSKI

1 Q. Please state your name, business address, and  
2 present position with Idaho Power Company ("Idaho Power" or  
3 "Company").

4 A. My name is Pawel ("Paul") P. Goralski. My  
5 business address is 1221 West Idaho Street, Boise, Idaho  
6 83702. I am employed by Idaho Power as a Regulatory  
7 Consultant in the Regulatory Affairs Department.

8 Q. Please describe your educational background.

9 A. In May of 2007, I received a Bachelor of  
10 Business Administration degree in Finance from Boise State  
11 University in Boise, Idaho. I have also attended "The  
12 Basics: Practical Regulatory Training for the Electric  
13 Industry," an electric utility ratemaking course offered  
14 through the New Mexico State University's Center for Public  
15 Utilities, "Electric Utility Fundamentals and Insights," an  
16 electric utility course offered by Western Energy  
17 Institute, and "Electric Rates Advanced Course," an  
18 electric utility ratemaking course offered through the  
19 Edison Electric Institute.

20 Q. Please describe your work experience with  
21 Idaho Power.

22 A. In 2017, I was hired as a Regulatory Analyst  
23 in the Company's Regulatory Affairs Department, and in 2020  
24 I was promoted to my current position of Regulatory

1 Consultant. My primary responsibilities include supporting  
2 the Company's class cost-of-service ("CCOS") activities,  
3 developing pricing for special contract customers and other  
4 large load pricing analysis, supporting the Company's  
5 annual Fixed Cost Adjustment ("FCA") calculation, and  
6 serving as the Company witness in that matter. I have also  
7 been its witness for the Company's annual Demand-Side  
8 Management ("DSM") prudency filings.

9 Q. What is the purpose of your testimony in  
10 this matter?

11 A. My testimony will address derivation of the  
12 Company's 2023 CCOS study and the resulting recommendations  
13 for customer pricing components. Specifically, my testimony  
14 covers the following six areas: 1) CCOS - overview,  
15 proposed modifications to methodology, description, and  
16 study results, 2) allocation of CCOS-informed revenue  
17 requirement to customer classes, 3) computation of the  
18 Sales Based Adjustment Rate ("SBAR") consistent with the  
19 methodology described in the Settlement Agreement in Case  
20 No. IPC-E-15-15,<sup>1</sup> 4) update to FCA components as informed by  
21 the 2023 CCOS study and related rate design proposals, 5)  
22 Special Contract pricing and rate design, and, 6) Schedule

---

<sup>1</sup> *In the Matter of Idaho Power Company's Application for Approval of Computational Modifications to the True-Up Portion of the Power Cost Adjustment*, Case No. IPC-E-15-15 (filed April 28, 2015; Final Order No. 33307 issued May 28, 2015).

1 20 - High-Density Load ("Schedule 20") pricing and update  
2 on Schedule 20 customers and interruption compensation.

3 **I. CLASS COST-OF-SERVICE OVERVIEW**

4 Q. Please describe in general terms the process  
5 used to prepare the class cost-of-service study.

6 A. There are two general steps used in  
7 preparing a class cost-of-service study. The first step is  
8 to determine the total costs of providing electric service,  
9 adjusted for normal weather and water conditions. These  
10 costs have been provided to me by Company Witness Ms.  
11 Kelley Noe on Exhibit No. 35. The next step is to establish  
12 a methodology for the separation of those costs among  
13 customer classes.

14 Q. What methodology is used to separate costs  
15 among customer classes?

16 A. The methodology for separating costs among  
17 classes consists of a three-step process generally referred  
18 to as functionalization, classification, and allocation. In  
19 all three steps, recognition is given to the way in which  
20 the costs are incurred by relating these costs to the way  
21 in which the utility is operated to provide electrical  
22 service.

23 Q. Please explain the meaning of  
24 functionalization.

1           A.           Costs must be functionalized; that is,  
2 identified with utility operating functions. Operating  
3 functions recognize the different roles played by the  
4 various facilities in the electric utility system. In the  
5 Company's accounts, these various roles are already  
6 recognized to some degree, particularly in the recording of  
7 plant costs as production-, transmission-, or distribution-  
8 related. However, this functional breakdown is not  
9 sufficiently detailed for cost-of-service purposes.  
10 Individual plant items are examined and, where possible,  
11 the associated investment costs are assigned to one or more  
12 operating functions, such as substations, primary lines,  
13 secondary lines, and meters. This level of  
14 functionalization allows costs to be more equitably  
15 allocated among classes of customers.

16           Q.           Please explain the meaning of  
17 classification.

18           A.           In addition to functionalization,  
19 classification refers to the identification of a cost as  
20 being either customer-related, demand-related, or energy-  
21 related. These three cost components are used to reflect  
22 the fact that an electric utility makes service available  
23 to customers on a continuous basis, provides as much  
24 service, or capacity, as the customer desires at any point  
25 in time, and supplies energy, which provides the customer

1 the ability to do useful work over an extended period of  
2 time. These three concepts of availability, capacity, and  
3 energy are related to the three components of cost  
4 designated as customer, demand, and energy, respectively.  
5 In order to classify a particular cost by component,  
6 primary attention is given to whether the cost varies as a  
7 result of changes in the number of customers, changes in  
8 demand imposed by the customers, or changes in energy used  
9 by the customers.

10 Q. What are some examples of customer-, demand-  
11 and energy-related costs?

12 A. Examples of customer-related costs are the  
13 plant investments and expenses that are associated with  
14 meters and service drops, meter reading, billing and  
15 collection, and customer information and services, as well  
16 as a portion of the investment in the distribution system.  
17 These investments and expenses are made and incurred based  
18 on the number of customers, regardless of the amount of  
19 energy used, and are, therefore, generally considered to be  
20 fixed costs. Demand-related costs are the fixed costs  
21 associated with investments in generation, transmission,  
22 and a portion of the distribution plant and the associated  
23 operation and maintenance expenses necessary to accommodate  
24 the maximum demand imposed on the Company's system. Energy-

1 related costs are generally the variable costs associated  
2 with the operation of the generating plants, such as fuel.

3 Q. What did you use as your primary guide in  
4 classifying costs as either customer-, demand-, or energy-  
5 related?

6 A. I used the *Electric Utility Cost Allocation*  
7 *Manual*, published January 1992, by the National Association  
8 of Regulatory Utility Commissioners as my primary guide to  
9 the classification of customer-, demand-, and energy-  
10 related costs.

11 Q. Please explain the process of allocation.

12 A. The process of allocation is one of  
13 apportioning the total jurisdictional cost among classes by  
14 introducing allocation factors into the process. An  
15 allocation factor is nothing more than an array of numbers  
16 that specifies the class value or share of a total  
17 jurisdictional quantity.

18 Once individual costs have been allocated to the  
19 various classes of service, it is possible to total these  
20 costs as allocated and arrive at a breakdown of utility  
21 rate base and expenses by class. The results are stated in  
22 a summary form to measure adequacy of revenues for each  
23 class. The measure of adequacy is typically the rate of  
24 return earned on rate base compared to the requested rate  
25 of return.

1 Q. Have you provided separate documentation  
2 describing in detail the methodology used to prepare the  
3 Company's class cost-of-service study?

4 A. Yes. Exhibit No. 36, the Class Cost-of-  
5 Service Process Guide, describes in detail the methodology  
6 used in the preparation of the Company's class cost-of-  
7 service study.

8 **II. PROPOSED MODIFICATIONS TO THE COMPANY'S COST-OF-**  
9 **SERVICE METHODOLOGY**

10 Q. Is the Company proposing modifications to  
11 the CCOS study methodology most recently approved by the  
12 Idaho Public Utilities Commission ("Commission") in the  
13 2008 general rate case ("GRC") and that was also utilized  
14 in the 2011 GRC?

15 A. Yes. I am proposing two modifications to the  
16 CCOS methodology most recently approved by the Commission.  
17 However, much of the study's methodology remains consistent  
18 with the 2008 and 2011 GRC CCOS studies.<sup>2</sup>

19 Q. Please describe the primary elements that  
20 remain consistent between the 2023 CCOS and the study  
21 prepared for the 2011 GRC.

---

<sup>2</sup> *In the Matter of the Application of Idaho Power Company for Authority to Increase its Rates and Charges for Electric Service to its Customers in the State of Idaho*, Case No. IPC-E-11-08, Larkin DI (filed June 1, 2011).

*In the Matter of the Application of Idaho Power Company for Authority to Increase its Rates and Charges for Electric Service*, Case No. IPC-E-08-10, Tatum DI (filed June 27, 2008).

1           A.           Generally, the 2023 CCOS remains consistent  
2 with the 2011 CCOS study, including, but not limited to:

- 3           • Demand-classified base-load serving generation  
4           plant is allocated based on a monthly system  
5           coincidence peak ("12CP") allocator;
- 6           • The Company's hydro and coal-fueled generation  
7           plants are functionalized as base-load serving  
8           generation resources, while the Danskin and  
9           Bennett Mountain natural gas-fueled generation  
10          plants are functionalized as peak-load serving  
11          generation resources;
- 12          • Transmission plant is 100 percent demand-  
13          classified and allocated based on a 12CP,  
14          marginal-cost weighted allocator;
- 15          • Energy-related cost allocators continue to be  
16          derived based on an averaging approach  
17          inclusive of marginal-cost weighting;
- 18          • The Company's 12CP values, and each class's  
19          share of that value, is adjusted to add back  
20          the impact of Demand Response, that is, system  
21          load is representative of load as if no Demand  
22          Response events had been called; and
- 23          • Classification of distribution plant between  
24          demand and customer is based on a three-year  
25          load duration curve.

1 Q. Please describe the first modification made  
2 to CCOS methodology.

3 A. As described by Company Witness Ms.  
4 Aschenbrenner, analysis completed in support of the  
5 Company's upcoming 2023 Integrated Resource Plan indicates  
6 there is a probability that high-risk hours occur into the  
7 month of September. As a result, I recommend allocation of  
8 peak-load serving resources be based on a summer period  
9 June through September 4CP allocator, updated from the June  
10 through August 3CP allocator utilized in the 2011 CCOS. The  
11 four-month summer season better aligns with current and  
12 future high-risk hours and the need to rely on peak-load  
13 serving resources to meet those high-risk hours.

14 Q. Did the CCOS modification to extend the  
15 summer season to include September impact all customer  
16 classes?

17 A. No. Idaho Power's Irrigation class service  
18 schedule, Schedule 24, has previously utilized a different  
19 seasonal definition than other rate schedules. While all  
20 other Idaho Power rate schedules with seasonal rates have  
21 previously defined the summer season as June through  
22 August, the Irrigation customer class has historically  
23 received a portion of cost allocation and rates based on a  
24 summer period definition including September. The proposed  
25 CCOS modification for summer-season baseload serving

1 generation resources to be allocated on a June through  
2 September period aligns cost allocation for the summer  
3 season for all customer classes.

4 Q. Please describe the second recommended CCOS  
5 modification.

6 A. In past studies, classification of Idaho  
7 Power's cost of generation - with respect to base-load  
8 serving generation plant rate base, expenses, and power  
9 supply expenses - has included both energy and demand  
10 classification based on a jurisdictional load factor. That  
11 is, if the Idaho jurisdictional load factor was 55 percent,  
12 55 percent of baseload generation plant was classified as  
13 energy, with amounts exceeding the jurisdictional load  
14 factor classified as demand-related.

15 Idaho Power proposes to change classification  
16 methodology such that energy and demand classification  
17 follow a more "accounting-like" fixed cost versus variable  
18 cost approach. All base-load serving generation fixed  
19 accounting costs would be 100 percent demand classified,  
20 and all variable expenses, such as fuel and purchased power  
21 expenses, would be 100 percent energy classified.

22 Q. How does this impact the classification of  
23 generation and power supply by FERC account?

24 A. Please see Table 1 for a comparison of main  
25 FERC account classification under the recommended

1 methodology and the Company's previous methodology. Peak-  
 2 load generation plant continues to be 100 percent demand-  
 3 classified and fuel expense continues to be 100 percent  
 4 energy classified. For base-load serving generation plant:  
 5 hydro, steam, and natural-gas fueled, 100 percent of  
 6 generation plant is demand-classified. Power supply  
 7 expense, including account 555.0 purchased power, and 555.1  
 8 - PURPA are 100 percent energy classified. It should be  
 9 noted that while Table 1 is not a comprehensive list of  
 10 impacted FERC accounts (there are also impacts to composite  
 11 allocators that include the FERC accounts below), the list  
 12 identifies the primary accounts that drive changes in cost  
 13 assignment.

14 **Table 1**  
 15 Primary Production & Power Supply Expense FERC Account  
 16 Classification Comparison

<u>FERC</u> <u>Account</u>	<u>Description</u>	<u>Prior</u> <u>Classification</u>	<u>Recommended</u> <u>Classification</u>
501	Steam Plant - Fuel	100% Energy	100% Energy
<b>536</b>	<b>Water lease &amp; Other</b>	<b>Demand/Energy</b>	<b>100% Energy</b>
547	Other Generation - Diesel	100% Energy	100% Energy
547	Other Generation - Other Fuel	100% Energy	100% Energy
<b>555.1</b>	<b>Purchased Power</b>	<b>Demand/Energy</b>	<b>100% Energy</b>
555.1	Purchased Power - Demand Response Incentives	100% Demand	100% Demand
<b>555.2</b>	<b>Purchased Power - PURPA</b>	<b>Demand/Energy</b>	<b>100% Energy</b>
<b>310-316</b>	<b>Steam Production</b>	<b>Demand/Energy</b>	<b>100% Demand</b>
<b>330-336</b>	<b>Hydraulic Production</b>	<b>Demand/Energy</b>	<b>100% Demand</b>
<b>340-346</b>	<b>Other Production - Langley</b>	<b>Demand/Energy</b>	<b>100% Demand</b>

17

18 Q. Why is the Company proposing this change in  
 19 classifying costs?

1           A.           Idaho Power has used, and the Commission has  
2 approved, the use of a jurisdictional load factor to  
3 classify base-load generation expense since the early  
4 1980s. As explained by Ms. Aschenbrenner, the Company seeks  
5 to modernize rate design to better align cost-causation  
6 with fixed and variable components of Idaho Power's cost  
7 structures. Because the results of classification are used  
8 to inform rate design, I am proposing a method to align  
9 with the Company's rate design objectives.

10           Q.           What additional changes are incorporated in  
11 the 2023 CCOS study?

12           A.           There are several cost categories that are  
13 new to the CCOS study since the Company's 2011 GRC. The  
14 more recent cost categories are described in detail in Mr.  
15 Larkin's testimony, and are allocated in the CCOS study in  
16 the following manner:

- 17           • Other Production - Langley: base-load serving  
18           generation; 100 percent demand-classified;
- 19           • 120 megawatt ("MW") battery storage: base-load  
20           generation; 100 percent demand-classified;
- 21           • Jackpot Power Purchase Agreement ("PPA"):<sup>3</sup> 100  
22           percent energy classified;

---

<sup>3</sup> The Jackpot PPA is described in the Direct Testimony of Company Witness Ms. Jessica Brady.

- 1           • Energy Imbalance Market expenses: follows  
2           transmission plant allocation as the ability for  
3           Idaho Power to access the market is determined by  
4           transmission capacity;
- 5           • Western Resource Adequacy Program: also follows  
6           transmission plant allocation for FERC account  
7           561 - Transmission - Load Dispatching;
- 8           • Wildfire mitigation: wildfire mitigation supports  
9           the Company's overall electrical system and is  
10          allocated based on a composite allocator for  
11          generation, transmission, and distribution plant.

12          Q.        Are there any other major changes to the  
13          2023 CCOS study from the CCOS filed in the 2011 GRC?

14          A.        Yes, the 2023 CCOS study separately  
15          allocates costs to the on-site generation class for  
16          Residential, Schedule 6, and Small-General service,  
17          Schedule 8, as independent rate classes for cost  
18          assignment. The Commission approved the creation of  
19          Schedule 6 and 8 in 2018.<sup>4</sup> These load statistics were  
20          developed by the Company's Load Research and Forecasting  
21          Department and are described in workpapers filed by Mr.  
22          Larkin.

---

<sup>4</sup> *In the Matter of the Application of Idaho Power Company for Authority to Establish New Schedules for Residential and Small General Service Customers with On-Site Generation*, Case No. IPC-E-17-13, Order No. 34046 (May 9, 2018).

1 Q. How are the clean energy aspects of Micron's  
2 Special Contract accounted for in the CCOS?

3 A. As described in Mr. Larkin's testimony,  
4 because costs and revenues from Micron's payment for the  
5 Black Mesa PPA are offsetting, they are excluded from the  
6 Idaho jurisdictional revenue requirement, and are also  
7 excluded from CCOS. While costs and revenues were excluded  
8 from CCOS, derivation of the energy-allocator for Micron  
9 was adjusted to exclude energy met by the Black Mesa  
10 resource. That is, the energy service Micron requires from  
11 Idaho Power is reduced by the forecast generation of the  
12 Black Mesa PPA, consistent with the Special Contract  
13 billing construct. This modification ensures Micron  
14 receives its fair, allocable share of power supply expense  
15 for the portion of load met by Idaho Power.

16 **III. COST-OF-SERVICE STUDY DESCRIPTION**

17 Q. Have you prepared a table that summarizes  
18 the basis by which each of the major functionalized cost  
19 categories has been classified and subsequently allocated  
20 to customer classes under the CCOS?

21 A. Yes. The Table 2 summarizes the basis by  
22 which each of the major functionalized cost categories is  
23 classified and subsequently allocated to customer classes  
24 under the CCOS:

1 **Table 2**  
 2 CCOS Classification and Functionalization Summary

<b>Cost Category</b>	<b>Classification Basis</b>
<b>Generation Plant</b>	
Hydro and Steam Production	Demand
Other Production (Langley & Peaking Units)	Demand
<b>Transmission Plant</b>	Demand
<b>Distribution Plant</b>	Demand and Customer
<b>Other Expenses</b>	
Fuel	Energy
Purchased Power	Energy
Demand Response Incentive Payments	Demand
<b>Cost Category</b>	<b>Allocation Basis</b>
<b>Generation Demand</b>	
Hydro and Steam Production	12CP without Marginal Generation Cost Weighting
Other Production (Langley)	12CP without Marginal Generation Cost Weighting
Other Production (Peaking Units)	4CP without Marginal Generation Cost Weighting
Demand Response Incentive Payments	4CP without Marginal Generation Cost Weighting
<b>Generation Energy</b>	12 Months Energy with Marginal Energy Cost Weighting (averaged w/ un-weighted values)
<b>Transmission</b>	12CP with Marginal Transmission Cost Weighting
<b>Distribution</b>	1NCP / No. of Customers / Direct Assignment

3  
 4 Q. Please identify the exhibits that comprise  
 5 the cost-of-service study.

1           A.        The cost-of-service study is comprised of  
2 the following exhibits:

- 3           1. Exhibit No. 37, Functionalization and  
4            Classification of Costs;
- 5           2. Exhibit No. 38, Summary of Functionalized  
6            Costs;
- 7           3. Exhibit No. 39, Allocation to Classes;
- 8           4. Exhibit No. 40, Summary of Class Allocations;
- 9           5. Exhibit No. 41, Transfer Adjustment;
- 10          6. Exhibit No. 42, Revenue Requirement Summary;
- 11          7. Exhibit No. 43, Class Cost-of-Service Unit  
12            Costs;
- 13          8. Exhibit No. 44, Marginal Cost Study
- 14          9. Exhibit No. 45, Development of Weighted Demand  
15            and Energy Allocators;
- 16          10. Exhibit No. 46, Revenue Requirement  
17            Adjustments.

18           Q.        Please describe Exhibit No. 37.

19           A.        Exhibit No. 37 contains 145 pages and  
20 consists of 11 Cost Functionalization and Classification  
21 Tables. The functionalization and classification of each  
22 component of rate base, operating revenue, and expense are  
23 treated in detail in these tables. The tables are shown in  
24 the following sequence:

- 25           • Table 1 - Electric Plant in Service;

- 1 • Table 2 - Accumulated Provision for  
2 Depreciation;
- 3
- 4 • Table 3 - Additions and Deletions to Rate  
5 Base;
- 6
- 7 • Table 4 - Operating Revenues;
- 8
- 9 • Table 5 - Operation and Maintenance  
10 Expenses;
- 11 • Table 6 - Depreciation and Amortization  
12 Expense;
- 13
- 14 • Table 7 - Taxes Other Than Income Taxes;
- 15
- 16 • Table 8 - Regulatory Debits/Credits;
- 17
- 18 • Table 9 - Income Taxes;
- 19
- 20 • Table 10 - Development of Labor-Related  
Allocator; and
- 21 • Table 11 - Functionalization Allocators.

22 Q. What is the significance of the column header  
23 "Allocator" on Exhibit No. 37?

24 A. This column identifies, by symbol, the basis  
25 for each allocation. For example, for Accounts 310 through  
26 316, Steam Production, shown at line 20 on page 1, the  
27 constant "PI-S" is used to allocate the total investment in  
28 steam production plant to the production function and to  
29 the demand cost classifications. The resultant  
30 functionalization of costs may itself serve as a basis for  
31 subsequent allocations. This use is illustrated at line 119  
on page 21 where the accumulated depreciation for steam

1 production plant is allocated according to the same  
2 allocator "PI-S" used at line 20.

3 Q. Please describe Exhibit No. 38.

4 A. Exhibit No. 38 summarizes in row format the  
5 functionalized costs for each component of rate base and  
6 expenses shown across the columns on Exhibit No. 37.

7 Q. Please describe Exhibit No. 39.

8 A. Exhibit No. 39 details the allocation of the  
9 summarized costs shown on Exhibit No. 38 to each customer  
10 class, including the Special Contract customers. The  
11 exhibit also includes a summary of results showing the  
12 actual rate of return earned for each customer class and  
13 Special Contract customer. The exhibit includes the  
14 following tables:

- 15 • Table 1 - Plant in Service;
- 16 • Table 2 - Accumulated Reserve for  
17 Depreciation;
- 18
- 19 • Table 3 - Amortization Reserve;
- 20 • Table 4 - Substation Contributions in Aid  
21 of Construction;
- 22 • Table 5 - Customer Advances for  
23 Construction;
- 24
- 25 • Table 6 - Accumulated Deferred Income  
26 Taxes;
- 27
- 28 • Table 7 - Acquisition Adjustment;
- 29 • Table 8 - Working Capital;

- 1 • Table 9 - Deferred Programs;
- 2 • Table 10 - Subsidiary Rate Base;
- 3 • Table 11 - Plant Held for Future Use;
- 4 • Table 12 - Other Revenues;
- 5 • Table 13 - Operation & Maintenance
- 6 Expenses;
- 7
- 8 • Table 14 - Depreciation Expense;
- 9 • Table 15 - Amortization of Limited Term
- 10 Plant;
- 11
- 12 • Table 16 - Taxes Other Than Income;
- 13 • Table 17 - Regulatory Debits/Credits;
- 14 • Table 18 - Provisions for Deferred Income
- 15 Taxes;
- 16
- 17 • Table 19 - Investment Tax Credit
- 18 Adjustment;
- 19
- 20 • Table 20 - Construction Work In Progress;
- 21 • Table 21 - State Income Taxes;
- 22 • Table 22 - Federal Income Taxes; and
- 23 • Table 23 - Allocation Factor Summary.

24 Q. Does the Class Cost-of-Service Process Guide,  
25 Exhibit No. 36, detail the manner in which you allocated  
26 the summarized costs shown on Exhibit No. 38 to each class  
27 of service as shown on Tables 1 through 22 of Exhibit No.  
28 39?

29 A. Yes. Exhibit No. 36, the Class Cost-of-Service  
30 Process Guide, details the majority of the allocation

1 methodology that was applied to produce the results shown  
2 on Tables 1 through 22 of Exhibit No. 39.

3 Q. What additional allocation methodology was  
4 included in the CCOS to produce the summarized costs shown  
5 on Exhibit No. 42?

6 A. As described by Mr. Larkin, the Jurisdictional  
7 Separation Study includes three additional revenue  
8 requirement line items: 1) Bridger revenue requirement, 2)  
9 Valmy revenue requirement, and 3) revenue requirement  
10 offset for battery projects to be installed in 2023.  
11 Revenue requirements for those three items were allocated  
12 to customer classes consistent with other base-load serving  
13 generation plant. Please see Exhibit No. 46 Revenue  
14 Requirement Adjustments for each class's calculated  
15 allocable share. The result of that class allocation for  
16 the three revenue requirement items is listed by customer  
17 class on row 45 of Exhibit No. 42 Revenue Requirement  
18 Summary.

19 A second allocation was included to spread to  
20 customer classes the transfer adjustment described by Mr.  
21 Larkin. The total value of the Energy Efficiency Rider  
22 labor adjustment and update to Power Cost Adjustment  
23 ("PCA")-related items were allocated to customer classes in  
24 the same manner as they would be incurred. Exhibit No. 41,

1 Transfer Adjustment, computes the base revenue transfer for  
2 each customer class.

3 Q. Does Exhibit No. 39 include a listing of the  
4 allocation factors used to allocate to classes the various  
5 costs shown on Tables 1 through 22?

6 A. Yes. Table 23 of Exhibit No. 39 includes a  
7 listing of each allocation factor.

8 Q. Have you included information regarding the  
9 derivation of the Company's updated marginal costs with  
10 your testimony?

11 A. Yes. I have included a copy of the Company's  
12 2023 Marginal Cost Analysis Study as Exhibit No. 44.

13 Q. Have the marginal costs been used to develop  
14 the Company's revenue requirement?

15 A. No. The marginal costs have been used solely  
16 for purposes of developing allocation factors and not for  
17 purposes of developing the Company's revenue requirement.

18 Q. Have you prepared an exhibit that details the  
19 derivation of the demand and energy allocation factors used  
20 in the cost-of-service study?

21 A. Yes. Exhibit No. 45 details the derivation of  
22 the allocation factors D10S, D10NS, D10P, D13, E10S, and  
23 E10NS used in the CCOS.

1                                   **IV.    COST-OF-SERVICE STUDY RESULTS**

2           Q.           Please describe Exhibit No. 42.

3           A.           Exhibit No. 42 is the revenue requirement  
4 summary based on the results of the proposed CCOS study.  
5 The section headed "Revenue Requirement for Rate Design"  
6 details the sales revenue required from each customer class  
7 and special contract customer. The sales revenue required  
8 includes return on rate base, total operating expenses, and  
9 incremental taxes computed using the net-to-gross  
10 multiplier of 1.347 provided by Ms. Noe.

11          Q.           Have you prepared an exhibit quantifying the  
12 impact from the recommended CCOS modifications?

13          A.           Yes, Exhibit No. 47 to my testimony includes  
14 the results of the 2023 CCOS study and the three  
15 supplemental CCOS studies. The exhibit is presented with  
16 the first section representing a CCOS study consistent with  
17 the 2011 GRC methodology; the two subsequent sections  
18 independently list the incremental change to revenue  
19 requirement by class from that respective modification.  
20 Finally, the combined impact of the modifications and the  
21 2023 CCOS class revenue requirement results are listed in  
22 the fourth section.

23          Q.           Please summarize the major impacts to  
24 customer classes from the recommendations.

1           A.           The greatest impact is to the Irrigation  
2 customer class, which is primarily driven by shifting to a  
3 four-month summer season for all customer classes, and  
4 results in a reduction in revenue deficiency of \$3.7  
5 million (as compared to the 2011 GRC methodology) from this  
6 modification. However, while each class experiences a  
7 slight change to revenue requirement from the two proposed  
8 changes, the greatest percentage total impact is a 2.65  
9 percent reduction in revenue deficiency for the Irrigation  
10 class, nearly all due to the four-month summer season, with  
11 almost all other classes experiencing less than 1 percent  
12 impact to revenue requirement from the proposed methodology  
13 changes.

14           Q.           Please summarize the results of the class  
15 cost-of-service study that are detailed on Exhibit No. 42.

16           A.           The results shown on Exhibit No. 42 indicate  
17 that the Residential ("Schedule 1"), Residential On-Site  
18 Generation ("Schedule 6"), Small General Service ("Schedule  
19 7"), Small General Service On-Site Generation ("Schedule  
20 8") Irrigation Service ("Schedule 24"), and Traffic Control  
21 Lighting Service ("Schedule 42") should have an increase in  
22 rates that is greater than the overall average increase  
23 requested by the Company. In addition, the results indicate  
24 that Large General Service - Primary & Transmission  
25 ("Schedules 9P and 9T"), Dusk to Dawn Lighting ("Schedule

1 15"), Municipal Street Lighting ("Schedule 41"), and  
2 Special Contract customer J. R. Simplot Company Pocatello,  
3 Idaho ("Simplot Pocatello") ("Schedule 29") should have a  
4 decrease in rates from the current level.

5 **V. REVENUE REQUIREMENT ALLOCATION**

6 Q. What is the Company's general ratemaking  
7 philosophy on determining class-specific revenue  
8 requirement and the resulting customer rates?

9 A. The Company's primary approach to ratemaking  
10 in the last several GRCs has been to establish rates that  
11 reflect costs as accurately as possible. Accordingly, the  
12 Company's ratemaking proposals usually advocate movement  
13 toward cost-of-service results, which assign costs to those  
14 customer classes that cause the Company to incur the costs.

15 Q. Are there other objectives that may be  
16 considered in the ratemaking process?

17 A. Yes. The Commission may consider a number of  
18 other objectives, such as rate stability, in the  
19 determination of rates.

20 Q. How did you approach the determination of  
21 the revenue requirement for each customer class?

22 A. As I described above, a pure cost-of-service  
23 revenue requirement spread would result in larger increases  
24 for certain classes relative to the overall average  
25 increase. In order to mitigate the magnitude of the maximum

1 rate increase any class would experience, the Company is  
2 proposing to cap the percentage increase to any customer  
3 class at one and one-half times the overall average  
4 requested increase, or 12.91 percent (8.61 percent X 1.5 =  
5 12.91 percent). As proposed, Large General Service -  
6 Primary & Secondary, Dusk to Dawn Lighting, Municipal  
7 Street Lighting and the Simplot Pocatello Special Contract  
8 receive neither a decrease nor an increase in rates.

9 Q. Did you discuss the results of the CCOS  
10 study internally before deciding to apply the 12.91 percent  
11 caps to the specified customer classes?

12 A. Yes. I discussed the results of the CCOS and  
13 potential rate spread scenarios with Company Witness Mr.  
14 Timothy Tatum, who is responsible for the overall  
15 preparation of this case. My revenue allocation is the  
16 result of those discussions.

17 Q. Was the revenue allocation process affected  
18 by the clean energy aspects of Micron's Special Contract?

19 A. No. Micron's revenue targets were developed  
20 for the portion of service Idaho Power provides.

21 Q. Does the overall 12.91 percent cap also  
22 apply to new customer classes Schedule 6 and 8?

23 A. Not explicitly. However, consistent with the  
24 direction provided by Ms. Aschenbrenner, the Residential  
25 and Residential On-Site Generation customer classes were

1 combined prior to determining the revenue target. The same  
2 occurred for Small General Service and its On-Site  
3 Generation counterpart. As further discussed in the Direct  
4 Testimony of Company Witness Mr. Grant Anderson and Company  
5 Witness Mr. Zack Thompson, respectively, rate design was  
6 developed such that Schedule 1 and Schedule 6 share the  
7 same service charge and energy rates, with that also being  
8 the case for Schedule 7 and Schedule 8.

9 Q. Do you have an exhibit that details the  
10 class revenue requirement determination?

11 A. Yes. Exhibit No. 48 is a five-page exhibit  
12 that steps through the revenue requirement allocation  
13 process from the CCOS results to the ultimate proposal for  
14 each customer class. Page 1 of Exhibit No. 48 presents the  
15 proformed normalized test year sales and revenues and  
16 transfer adjustment by customer class. Page 2 details the  
17 results from the CCOS study and illustrates the revenue  
18 changes that would be made to each customer class to obtain  
19 the CCOS results. Page 3 shows the revenue shortfall that  
20 resulted by applying the 12.91 percent cap to combined  
21 Small General Service classes, Irrigation, and Traffic  
22 Control Lighting, and no decrease to Large General Service  
23 - Primary & Secondary, Dusk to Dawn Lighting, Municipal  
24 Street Lighting, or Simplot Pocatello Special Contract.

25 Page 5 shows the final proposed increase to customer

1 classes that resulted from spreading the revenue shortfall  
2 created by the 12.91 percent cap, no increase or decrease  
3 to Large General Service - Primary & Secondary, Dusk to  
4 Dawn Lighting, Municipal Street Lighting, or Simplot  
5 Pocatello Special Contract. The results from page 5 were  
6 utilized in determining the individual rates for the  
7 Company's general tariff and special contract customers.

8 Q. Did you also provide the results of the CCOS  
9 to the Company's rate design witnesses for use in the  
10 Company's rate design proposals along with the revenue  
11 targets from Exhibit No. 48?

12 A. Yes. I provided the CCOS unit costs,  
13 detailed on Exhibit No. 43, to Mr. Anderson, Mr. Thompson,  
14 and Company Witness Mr. Riley Maloney for use in  
15 determining the rates for their respective service  
16 schedules.

17 Q. Please describe Exhibit No. 43.

18 A. Exhibit No. 43 shows the unit cost for each  
19 function for metered service schedules as determined  
20 through the CCOS study. The billing units shown in the  
21 column labeled "(F)" reflect the billing demands,  
22 normalized billing energy, basic load capacity, and number  
23 of billings.

24 Q. Are you proposing any other changes to cost  
25 recovery?

1           A.           Yes, As discussed by Mr. Tatum, the Company  
2 is proposing to reduce the Energy Efficiency Rider  
3 ("Rider") collection percentage to 2.25 percent from 3.10  
4 percent. Exhibit No. 41 includes derivation of the proposed  
5 2.25 percent Rider collection percentage, with Rider  
6 collection projected to be \$31.6 million, just slightly  
7 above the current funding level when also considering the  
8 \$3.5 million of labor-related cost that will be collected  
9 in base rates.

10                           **VI. SALES BASED ADJUSTMENT RATE**

11           Q.           Please describe in general terms the purpose  
12 of the SBAR?

13           A.           The SBAR is a part of the PCA mechanism that  
14 is intended to eliminate recovery of power supply expenses  
15 associated with load growth resulting from changing weather  
16 conditions, a growing customer base, or changing customer  
17 use patterns.

18           Q.           Please describe the SBAR methodology  
19 approved by the Commission in Order No. 33307.

20           A.           Commission Order No. 33307 directs the  
21 Company to calculate the SBAR based on the energy  
22 classified portion of embedded production revenue  
23 requirement as established in the CCOS. The final SBAR is  
24 calculated by dividing this portion of revenue requirement  
25 by the Idaho kilowatt-hour ("kWh") sales for the test year.

1

2 Q. Are any additional modifications to  
3 calculate the SBAR necessary as part of the 2023 CCOS  
4 determination?

5 A. Yes. The Commission's Order adopted  
6 Commission Staff's ("Staff") recommendations for the PCA  
7 treatment of the renewable portion of Micron's billing  
8 construct,<sup>5</sup> which accepted the proposed treatment described  
9 in Ms. Aschenbrenner's testimony filed in Case No. IPC-E-  
10 22-06:<sup>6</sup>

11 Further, any energy requirements met by the  
12 Renewable Resource will not be included in the PCA  
13 sales based adjustment (SBA) and will not be used  
14 in the derivation of the future PCA rates. All  
15 Supplemental Energy supplied to Micron will be  
16 included in the PCA, SBA and used for PCA rate  
17 derivation purposes.

18  
19 Accordingly, the Black Mesa PPA power supply expense  
20 is excluded as part of the SBAR energy-related generation  
21 function revenue requirement, and the portion of Micron's  
22 energy that Black Mesa meets under the Special Contract  
23 billing construct is also excluded from test year retail  
24 sales.

25 Q. What is the resulting SBAR?

26 A. By applying the methodology established by

---

<sup>5</sup> *In the Matter of Idaho Power Company's Application for Approval of a Replacement Special Contract with Micron Technology, Inc. and a Power Purchase Agreement with Black Mesa Energy, LLC.*, Case No. IPC-E-22-06, Order No. 35482 (August 1, 2022); Staff Comments pg. 18.

<sup>6</sup> Case No. IPC-E-22-06, Aschenbrenner DI, pg. 20.

1 Commission Order No. 33307 in Case No. IPC-E-15-15, and for  
2 the Micron clean energy component of their Special Contract  
3 components by Order No. 35482, the SBAR should be increased  
4 from the requested level of \$26.72 in Case No. IPC-E-15-15  
5 to \$31.29 per megawatt-hour.

6 Q. Have you prepared an exhibit that details  
7 the derivation of the revised SBAR?

8 A. Yes. Exhibit No. 49, details the derivation  
9 of the \$31.29 SBAR amount.

10 **VII. FIXED COST ADJUSTMENT RATES**

11 Q. Please describe the FCA mechanism.

12 A. The FCA is a rate mechanism that is designed  
13 to remove the financial disincentive to utility acquisition  
14 of demand-side management resources. The mechanism  
15 accomplishes this goal by severing the link between energy  
16 sales and the recovery of fixed costs. The FCA applies to  
17 customer classes that only include energy and service  
18 charges in their retail billing components, Residential  
19 Service (Schedules 1, 3, 5, and 6) and Small General  
20 Service (Schedule 7, and 8). The annual FCA amount is  
21 determined according to the following formula:

22 
$$\text{FCA} = (\text{CUST} \times \text{FCC}) - (\text{ACTUAL} \times \text{FCE})$$

23 Where:

24 FCA = Fixed Cost Adjustment;

25 CUST = Actual number of customers, by class;

1           FCC = Fixed Cost per Customer, by class;  
2           ACTUAL = Actual Billed kWh Energy Sales, by  
3           class; and  
4           FCE = Fixed Cost per Energy, by class.

5           Q.       What values are required to calculate the  
6 FCA amount annually?

7           A.       As outlined in the above formula, for each  
8 class (Residential Service and Small General Service), the  
9 actual number of customers ("CUST"), the fixed cost per  
10 customer ("FCC"), actual energy ("ACTUAL"), and the Fixed  
11 Cost per Energy ("FCE") are required to determine the FCA  
12 amount. Two of these variables (CUST and ACTUAL) are  
13 determined at the end of each year based upon the Company's  
14 actual billing records. The other two variables (FCC and  
15 FCE) are updated each time the Company files a GRC and are  
16 based on the results of the CCOS study.

17          Q.       Since granting permanency for the FCA  
18 mechanism in Order No. 32505 in 2012,<sup>7</sup> has the Commission  
19 authorized any additional changes?

20          A.       Yes. First, the Commission approved a  
21 Settlement Stipulation in 2015 that replaced the use of  
22 weather-normalized data with actual sales in determination

---

<sup>7</sup> *In the Matter of the Application of Idaho Power Company for Authority to Convert Schedule 54 - Fixed Cost Adjustment - from a Pilot Schedule to an Ongoing Schedule*, Case No. IPC-E-11-19, Order No. 32505 (March 30, 2012).

1 of the FCA deferral.<sup>8</sup> Second, in 2021 the Commission  
2 approved separate, and reduced fixed cost tracking for  
3 customers considered "new," defined in the Order to be  
4 customers added after January 1, 2022.<sup>9</sup> The Commission's  
5 rationale stated that the modification "eliminates fixed  
6 cost recovery due to new customer growth for investments  
7 best determined in a general rate case."<sup>10</sup>

8 Q. Beginning with the 2024 FCA deferral, who  
9 will be considered a "new" customer?

10 A. The FCC and FCE rates will be reset based on  
11 outcomes of this GRC, as such, "new" customers will also be  
12 reset to be those customers added starting January 1, 2024,  
13 when proposed GRC rates go into effect.

14 Q. Are you proposing any additional  
15 modifications to the FCA as part of this proceeding?

16 A. Yes, I am proposing two additional  
17 modifications. First, because Schedule 6 and Schedule 8 are  
18 now separate rate classes in the CCOS study with individual  
19 cost assignment and independent class statistics, I  
20 recommend separate determination of use per customer  
21 ("UPC"), FCC, and FCE for these customer classes.

---

<sup>8</sup> *In the Matter of the Commission's Inquiry into Idaho Power Company's Fixed Cost Adjustment Mechanism*, Case No. IPC-E-14-17, Order No. 33295 (May 6, 2015).

<sup>9</sup> *Idaho Power Company's Application for Modification of the Fixed Power Cost Adjustment*, Case No. IPC-E-21-39, Order No. 35273 (Dec. 28, 2021).

<sup>10</sup> Order No. 35273, pg. 4.

1           Next, I am proposing separate determination for the  
2 UPC and FCE applied to customers taking service under the  
3 Proposed Schedule 5, Residential Service Time-of-Use Plan  
4 ("Schedule 5"). Cost assignment for Residential customers  
5 is completed on a composite group including Schedule 1, 3,  
6 and 5 customers and the FCC is calculated based on class  
7 statistics from this composite group. However, UPC for  
8 Schedule 5 is approximately 50 percent higher than the  
9 average Residential Service (Schedule 1) standard service  
10 customer. To appropriately track actual sales against a UPC  
11 basis, a class-specific UPC basis should be utilized.

12           For the FCE, derivation independent from composite  
13 Residential FCE rates should be utilized because of the  
14 proposed Schedule 5 rate design. As detailed in Mr.  
15 Anderson's testimony, the Company is pursuing an update to  
16 Schedule 5 time-of-use rates such that on- and off-peak  
17 energy rates maintain a four-to-one price differential in  
18 the summer season, and 1.5-to-one price differential in the  
19 non-summer season. That is, the summer on-peak energy rate  
20 will be four times the summer off-peak energy rate, and the  
21 non-summer on-peak energy rate will be 1.5 times the non-  
22 summer off-peak energy rate. Neither differential aligns  
23 with CCOS-informed rates, thus the FCE for Schedule 5  
24 incorporates a matching four-to-one differential for  
25 summer, and 1.5-to-one differential for non-summer

1 consumption, such that changes to Schedule 5 energy  
2 consumption in response to price signals between on- and  
3 off-peak periods recognize the embedded level of fixed  
4 costs in each time period. Schedule 5 customers who shift  
5 use from the on-peak period to the off-peak period do not  
6 receive an under- or over-collection of fixed costs between  
7 energy rates and the FCA mechanism because the FCE includes  
8 a four-to-one, and 1.5-to-one differential, respectively.

9 Q. Is the Company proposing changes to how  
10 annual FCA rates that recover the FCA deferral are set and  
11 applied to customer classes?

12 A. No. Annually, the FCA deferral will be  
13 tracked for five customer segments: Schedule 1 & 3,  
14 Schedule 5, Schedule 6, Schedule 7, and Schedule 8. The  
15 determination of annual FCA rates combines the Residential  
16 and Small General Service customer segments first, and sets  
17 the percentage change on an overall basis, not on a class-  
18 segment basis. FCA rates will continue to be set only at  
19 the total Residential (Schedule 1, 3, 5, and 6) segment,  
20 and Small General Service (Schedule 7, and 8) segment.

21 Q. Have you updated the FCC and FCE rates as  
22 part of this GRC proceeding?

23 A. Yes. I have updated the new and existing  
24 customer FCC and the FCE rates using the functionalized and  
25 classified revenue requirement from the 2023 CCOS, and

1 proposed Service Charge collection effective January 1,  
2 2024. The updated FCC and FCE rates have been included in  
3 the revised Schedule 54, Fixed Cost Adjustment.

4 Q. Please describe the process used to  
5 determine the FCC and FCE rates for the FCA mechanism,  
6 which have been submitted as part of this GRC proceeding.

7 A. The FCC and FCE rates submitted as part of  
8 this GRC proceeding are based upon the 2023 test year.  
9 These rates most accurately represent the Company's current  
10 fixed costs. Exhibit No. 50, Tables I, II, III, IV, and the  
11 Schedule 5 FCE derivation detail the computational process  
12 that was used to determine these class-specific fixed-cost  
13 amounts.

14 The first step in this process is a determination of  
15 the 2023 test year fixed cost recovery embedded in the  
16 energy charges for Residential Service and Small General  
17 Service customers. As can be seen on Exhibit No. 50, Table  
18 III, column J, for Residential Service, \$367,032,962 of  
19 fixed costs are to be recovered from residential customers  
20 through energy charges, and \$8,715,991 for Residential On-  
21 Site Generation customers. For Small General Service,  
22 \$8,266,319 of fixed costs are to be recovered from the  
23 energy charges, and \$27,218 for Small General Service On-  
24 Site Generation customers.

25 Q. Do these fixed cost amounts for the

1 Residential class include more than their actual class cost  
2 of service?

3 A. Yes. There is a difference between the class  
4 cost of service numbers and the amount of requested revenue  
5 requirement. This difference is a result of the cross-class  
6 subsidies that are currently present in the Company's rate  
7 structure. The total cross-class subsidies, as well as the  
8 fixed cost portion of those subsidies, are identified on  
9 Exhibit No. 50, Table II.

10 Q. Why is it important to include these fixed  
11 cost subsidies for the Residential class?

12 A. When fixed costs are recovered through a  
13 volumetric rate, the effects of any energy efficiency  
14 program that reduces energy consumption result in lost  
15 recovery of those fixed costs. In the case of the  
16 Residential classes, the reduction of energy consumption  
17 through energy efficiency not only prevents the Company  
18 from recovering the fixed costs associated with those  
19 classes, but in addition, prevents the fixed cost recovery  
20 of the other inter-class subsidies that are embedded in  
21 Residential energy rates.

22 Q. How are the class-specific fixed cost  
23 amounts established in the initial step used to derive the  
24 updated FCC rates?

25 A. The determination of the FCC rate utilizes

1 the annual average number of customers for the Residential  
2 customer class and Small General Service customer class.  
3 As can be seen on Exhibit No. 50, Table III, column A, the  
4 2023 average number of customers are 492,481 for the  
5 Residential customer class, 13,288 for the Residential On-  
6 Site Generation class, 30,401 for the Small General Service  
7 customer class, and 88 for the Small General Service On-  
8 Site Generation class.

9           With these two principal base level values, the FCC  
10 rate can be determined. The annual fixed costs recovered  
11 through the energy charges divided by the 2023 average  
12 number of customers results in an annual fixed cost  
13 recovery per customer, or the FCC rate, shown on Exhibit  
14 No. 50, Table III, column K. For the Residential class, the  
15 annual fixed cost recovery per customer is \$745.27  
16 ( $\$367,032,692 / 492,481$ ), and \$655.94 for the Residential  
17 On-Site Generation class ( $\$8,715,991 / 13,288$ ). For the  
18 Small General Service class, the annual fixed cost recovery  
19 per customer is \$271.91 ( $\$8,266,319 / 30,401$ ), and \$311.07  
20 for the Small General Service On-Site Generation class  
21 ( $\$27,218 / 88$ ).

22           For new customers, those added starting January 1,  
23 2024, the Fixed Cost per Customer - Distribution ("FCC-  
24 DIST") only includes distribution function fixed costs. The  
25 table below lists the corresponding FCC-DIST for each of

1 the FCA classes.

2 **Table 3**

3 New Customer FCC-DIST

<u>Customer Group</u>	<u>Total Distribution &amp; Customer Fixed Cost Revenue from Energy Charges</u>	<u>2023 Avg. Customers</u>	<u>FCC-DIST</u>
Residential	125,476,059	492,481	\$254.78
Residential On-Site Generation	3,620,717	13,288	\$272.49
Small General Service	3,257,318	30,401	\$107.15
Small General Service On-Site Generation	12,337	88	\$140.99

4

5 Q. How are the class-specific fixed cost  
6 amounts established in the initial step used to derive the  
7 updated FCE values?

8 A. The determination of the FCE rate utilizes  
9 the Residential and Small General Service weather-  
10 normalized energy consumption for the 2023 test year. As  
11 can be seen on Exhibit No. 50, Table III, column B, the  
12 2023 weather-normalized annual energy consumption for the  
13 Residential customer class is 5,425,559,433 kWh,  
14 122,912,496 kWh for Residential On-Site Generation  
15 customers, 138,285,160 kWh for the Small General Service  
16 class, and 370,708 kWh for the Small General Service On-  
17 Site Generation class.

18 The annual fixed cost recovered through the energy  
19 charges divided by the normalized energy results in an  
20 annual fixed cost recovery per kWh, or the FCE rate, shown  
21 on Exhibit No. 50, Table III, column L. Matching FCC-DIST  
22 determination for new customers, the FCE-DIST determination

1 for new customers added starting January 1, 2024, only  
 2 includes distribution-related fixed costs. Existing  
 3 customer FCE and new customer FCE-DIST are listed in Table  
 4 No. 4 for each of the FCA classes. Derivation of FCE-DIST  
 5 is shown on Exhibit No. 50, Table IV.

6 **Table 4**  
 7 FCE and FCE-DIST

<u>Total Fixed Cost Revenue from</u>			
<u>Customer Group</u>	<u>Energy Charges</u>	<u>2023 kWh</u>	<u>FCE</u>
Residential (Schedule 1, and 3)	367,032,962	5,425,559,433	\$0.067649
Residential On-Site Generation	8,715,991	122,912,496	\$0.070912
Small General Service	8,266,319	138,285,160	\$0.059777
Small General Service On-Site Generation	27,218	370,708	\$0.073423
	<u>Total Distribution &amp; Customer Fixed Cost Revenue from</u>		
<u>Customer Group</u>	<u>Energy Charges</u>	<u>2023 kWh</u>	<u>FCE-DIST</u>
Residential (Schedule 1, and 3)	125,476,059	5,425,559,433	\$0.023127
Residential On-Site Generation	3,620,717	122,912,496	\$0.029458
Small General Service	3,257,318	138,285,160	\$0.023555
Small General Service On-Site Generation	12,337	370,708	\$0.033278

8

9 Q. Please describe Schedule 5 FCE and FCE-DIST  
 10 derivation.

11 A. The kWh sales forecast for Schedule 5  
 12 customers is multiplied by the Residential FCE to determine  
 13 the actual fixed cost collection through the energy charge  
 14 in the forecast. That resulting value is removed from the  
 15 amount of energy sales revenue forecast for Schedule 5,  
 16 with the amount remaining considered to be the energy cost  
 17 in energy revenue. Energy cost in energy revenue is  
 18 seasonalized based on CCOS-informed summer/non-summer

1 energy cost ratio. Finally, the energy cost in energy  
2 revenue for that season is allocated to the on-peak and  
3 off-peak period based on the time-of-use billing  
4 determinants, with the per-energy unit cost retaining a  
5 four-to-one differential in the summer, and 1.5-to-one  
6 differential in the non-summer season. The proposed energy  
7 rates from Mr. Anderson's workpapers are reduced for the  
8 corresponding per-energy unit seasonal energy cost in  
9 energy revenue to calculate a matching differential  
10 Schedule 5 FCE rate. The process is replicated for the FCE-  
11 DIST for new Schedule 5 customers. Page 5 of Exhibit No. 50  
12 is the workpaper supporting derivation of Schedule 5 FCE  
13 and FCE-DIST rates.

14 Q. How do the FCC and FCE computed in this  
15 filing compare to the FCC and FCE established in the  
16 Company's last general rate case, IPC-E-11-08?

17 A. Both the FCC and FCE rates are greater than  
18 those currently in effect, which were established using the  
19 functionalized classified revenue requirement data in the  
20 Company's last filed general rate case, Case No. IPC-E-11-  
21 08. The Company has made significant investments in its  
22 infrastructure since that time, and the newly calculated  
23 FCC and FCE rates reflect those fixed costs that are being  
24 recovered through the Residential and Small General Service  
25 energy charges.

1 **VIII. SPECIAL CONTRACT CUSTOMERS**

2 Q. Please provide an overview of the Company's  
3 Special Contract customers and how rate design was  
4 developed.

5 A. There are six Special Contract customers and  
6 associated rate design proposals included in my testimony.  
7 First, I will review rate design proposals for Idaho  
8 Power's three long-standing Special Contract customers,  
9 Micron, Simplot Pocatello (Schedule 29), and the United  
10 States Department of Energy ("DOE"). Second, I will discuss  
11 development of rates for J. R. Simplot Company Caldwell,  
12 Idaho ("Simplot Caldwell") (Schedule 32), whose 2015  
13 Special Contract became active at the end of April 2023  
14 when it exceeded the 20 MW threshold for it to become  
15 effective. Finally, I will describe CCOS methodology and  
16 rate design for future Special Contract customers Brisbie,  
17 LLC ("Brisbie") and Lamb Weston.

18 Q. What are the Company's rate design proposals  
19 for the long-standing Special Contract customers, Micron,  
20 Simplot Pocatello, and the DOE?

21 A. The Company is proposing to maintain the  
22 current rate structures for the active Special Contract  
23 customers Micron, Simplot Pocatello, and DOE, but move the  
24 rate design components toward CCOS-informed amounts when  
25 increasing forecast collections to recover the revenue

1 requirement shown on Exhibit No. 48. This includes  
2 reestablishing the Contract Demand charge for Micron and  
3 Simplot Pocatello based on the same methodology the Company  
4 recently included in the Brisbie<sup>11</sup> and Lamb Weston  
5 contracts.

6 Q. Please describe the derivation of Micron's  
7 and Simplot's Pocatello Contract Demand rates.

8 A. Consistent with the method most-recently  
9 reviewed by the Commission as a reasonable basis for  
10 Contract Demand rates approved for Brisbie, and proposed  
11 for new Special Contract customer Lamb Weston, I propose  
12 Micron and Simplot Pocatello's Contract Demand rate is  
13 based on costs derived from the Company's Open Access  
14 Transmission Tariff ("OATT") rate effective October 1,  
15 2022. The OATT-based Contract Demand reflects the  
16 reservation cost that any other customer would pay on Idaho  
17 Power's system. To account for collection of costs by the  
18 Contract Demand charge, the Billing Demand rate is adjusted  
19 to collect any remaining fixed costs not collected through  
20 the Contract Demand charge.

21 Q. What other rate design elements for Micron,  
22 Simplot Pocatello, and DOE are proposed to be updated based  
23 on CCOS results?

---

<sup>11</sup> *In the Matter of Idaho Power's Application for Approval of Special Contract and Tariff Schedule 33 to Provide Electric Service to Brisbie, LLC's Data Center Facility*, Case No. IPC-E-21-42, Goralski DI, p. 13.

1           A.           I propose that the energy rate for Micron,  
2 Simplot Pocatello, and DOE match the CCOS-informed energy  
3 rate. This proposed change aligns rate design with cost  
4 causation by recovering only variable costs through the  
5 energy charge.

6           Q.           Have you included rate design workpapers for  
7 Micron, Simplot Pocatello, and DOE?

8           A.           Yes, Exhibit No. 51 includes rate design  
9 workpapers for all six Special Contract customers, current  
10 and future.

11          Q.           Please describe the Simplot Caldwell Special  
12 Contract pricing and CCOS analysis.

13          A.           As noted earlier, in late April 2023 Simplot  
14 Caldwell crossed the 20 MW customer load threshold to  
15 activate their Special Contract. Idaho Power endeavors that  
16 the GRC test year uses the best information available to  
17 the Company at the time of development. For Simplot  
18 Caldwell, while their Special Contract was approved in  
19 2015, prior to April, Simplot Caldwell had not previously  
20 exceeded the threshold to begin taking service under their  
21 Special Contract rates. Because historical customer usage  
22 has remained slightly below their forecast usage and they  
23 remained a Schedule 19 customer since approval of the  
24 Special Contract, Idaho Power included Simplot Caldwell as  
25 part of the Schedule 19 customer class in the 2023 GRC test

1 year load forecast, consistent with customer load until  
2 late April 2023.

3 For Simplot Caldwell, I completed pricing analysis  
4 by first removing their Schedule 19 load statistics from  
5 the CCOS study, and then added back their customer-provided  
6 Special Contract forecast load as an individual customer to  
7 complete cost assignment. This is similar to the approach  
8 Idaho Power has utilized when pricing new Special Contract  
9 customers between GRC, which is in alignment with the  
10 Commission's direction provided in Case No. IPC-E-13-23.<sup>12</sup>

11 Q. Was additional consideration required as  
12 part of developing Simplot Caldwell's proposed rate design?

13 A. Yes. It's important to distinguish the rates  
14 and revenue collection forecast for Simplot Caldwell in the  
15 2023 GRC test year, which are based on Schedule 19 rates  
16 and a lower, historical usage profile, versus the higher  
17 load forecast assumptions for cost assignment as a Special  
18 Contract. In the CCOS analysis, the historical basis  
19 Simplot Caldwell collections under Schedule 19 are  
20 approximately \$6.7 million, while the revenue requirement  
21 based on their higher, Special Contract load forecast is

---

<sup>12</sup> *In the Matter of the Application of Idaho Power Company for Approval of a Special Contract with J.R. Simplot Company, Case No. IPC-E-13-23, Order No. 33038 at 12 (May 19, 2014) (" . . . we find that a rate utilizing cost-of-service as a starting point for negotiation is consistent with prior Commission Orders and is fair, just and reasonable.")*

1 \$9.97 million. However, because Simplot Caldwell has  
2 existing Schedule 32 rates, rate design was evaluated by  
3 using current Schedule 32 rates applied to the higher,  
4 Simplot Caldwell load forecast used in the completion of  
5 the Special Contract CCOS cost assignment.

6 Q. What is the resulting revenue requirement  
7 change and proposed rate design for Simplot Caldwell?

8 A. I propose to increase Simplot Caldwell's  
9 revenue requirement by \$6,518 to bring them up to CCOS  
10 results, as revenue collection under existing Schedule 32  
11 rates and the forecast Special Contract load are nearly  
12 aligned with Simplot Caldwell's cost assignment. Consistent  
13 with rate design proposed for Micron and Simplot Pocatello,  
14 I propose to update Simplot Caldwell's Contract Demand rate  
15 to be OATT-based, and for the energy rate to match CCOS.

16 Q. How was pricing developed for future Special  
17 Contract customer Lamb Weston, which is an Idaho Power  
18 tariff Schedule 19P customer today?

19 A. Idaho Power recently filed an application to  
20 enter into a Special Contract with Lamb Weston in  
21 recognition of their forecast load exceeding 20 MW in July  
22 2023.<sup>13</sup> However, Lamb Weston's current load is less than 20  
23 MW, and the 2023 CCOS test year data includes Lamb Weston

---

<sup>13</sup> *In the Matter of Idaho Power's Application for Approval of Special Contract and Tariff Schedule 34 to Provide Electric Service to Lamb Weston, Inc.*, Case No. IPC-E-23-18, filed May 23, 2023.

1 as part of Schedule 19 load statistics, consistent with the  
2 level of service they currently receive from Idaho Power.

3 Similar to Simplot Caldwell, I completed pricing  
4 analysis by first removing Lamb Weston's Schedule 19 load  
5 statistics from the CCOS study, and then added back their  
6 future, customer-provided Special Contract steady-state  
7 forecast load as an individual customer to complete cost  
8 assignment.

9 Q. Why didn't the Company include Lamb Weston  
10 as a Special Contract customer in the GRC test year to  
11 develop rates?

12 A. Lamb Weston is in the process of a plant  
13 expansion at its facility in American Falls and is forecast  
14 to exceed the Schedule 19 service eligibility threshold in  
15 the second half of 2023 but not complete expansion until  
16 mid-2024. Due to uncertainty associated with the exact  
17 timing of that expansion, it is appropriate to include Lamb  
18 Weston's forecast Special Contract system utilization in a  
19 future GRC test year once that usage has been achieved.

20 If Lamb Weston was removed from the Schedule 19 test  
21 year load statistics but remained a Schedule 19 customer  
22 after the GRC, the total Schedule 19 class would be under-  
23 assigned costs, which would instead be allocated to all  
24 other Idaho Power customer classes. There is inherent  
25 regulatory lag when pricing new, proposed Special Contract

1 customers and the future point in time when all customer  
2 rates are re-balanced. The process Idaho Power followed to  
3 price Lamb Weston's Special Contract rates incorporates the  
4 best-known, historical information for this customer at the  
5 time of GRC filing.

6 Q. Please describe Lamb Weston's rate design  
7 components.

8 A. As described in more detail in the Company's  
9 recent filing for Commission approval of the Lamb Weston  
10 Special Contract, Case No. IPC-E-23-18, Lamb Weston's  
11 Special Contract rates incorporate a two-block, embedded  
12 and marginal-cost-based pricing structure. Block 1  
13 represents the first 20 MW of Lamb Weston's load and is  
14 priced at Schedule 19 - Primary retail rates, and Lamb  
15 Weston' load exceeding 20 MW is priced on an embedded cost  
16 basis for capacity and marginal cost basis for energy.  
17 Because block 1 references Schedule 19 rates, I propose  
18 mirroring the rates proposed by Mr. Anderson for Schedule  
19 19. The marginal energy cost portion of Lamb Weston's  
20 second block is based on an annual power supply cost  
21 forecast consistent with the PCA test year, with proposed  
22 marginal cost rate updates to occur at an annual interval  
23 in the spring with updated effective marginal energy rate  
24 each June 1<sup>st</sup>. My rate design focuses on the block 2 demand  
25 charge, which is the sole component that is determined by

1 CCOS for Lamb Weston as a class of one.

2 Q. What is the resulting proposed block 2  
3 Billing Demand Charge for Lamb Weston?

4 A. Lamb Weston's block 2 Billing Demand is  
5 proposed to be \$23.80 per kW. This represents recovery of  
6 Lamb Weston's CCOS revenue requirement, which will not be  
7 recovered under either block 1 rate components or the  
8 Contract Demand charge.

9 Q. How was pricing for Brisbie developed for  
10 their Special Contract rates?

11 A. Brisbie is forecast to come online beyond  
12 the test year period and as a result, no 2023 CCOS customer  
13 class adjustment was necessary to remove test year load for  
14 Brisbie. Similar to the methodology described in my  
15 testimony in the case to establish the current Brisbie,  
16 Schedule 33 rates,<sup>14</sup> for the loads that fall under the  
17 embedded portion of Brisbie's second block, Brisbie  
18 received their load ratio share of embedded capacity costs  
19 for a 30 MW steady-state operation assumption.

20 Brisbie's block 1 rates are fully-embedded and based  
21 on Schedule 19 - Transmission retail rates, which have been  
22 updated to match the proposed rates for Schedule 19

---

<sup>14</sup> *In the Matter of Idaho Power's Application for Approval of Special Contract and Tariff Schedule 33 to Provide Electric Service to Brisbie, LLC's Data Center Facility*, Case No. IPC-E-21-42, Goralski DI, p. 21-42.

1 provided by Mr. Anderson. Following the terms of the  
2 Brisbie Special Contract, the Contract Demand Charge, and  
3 Daily Excess Demand Charge have been updated based on the  
4 OATT rates in effect October 1, 2022. The remainder of  
5 Brisbie's block 2 rates are contractually established in  
6 the Brisbie Special Contract and follow an update schedule  
7 independent of updates to the Company's CCOS study.

8 Q. What is the resulting proposed block 2  
9 Billing Demand Charge for Brisbie?

10 A. Brisbie's block 2 Billing Demand is proposed  
11 to be \$22.07 per kW. This represents recovery of Brisbie's  
12 CCOS revenue requirement which will not be recovered under  
13 either block 1 rate components or the Contract Demand  
14 charge.

15 **IX. SCHEDULE 20 PRICING**

16 Q. Does the Company currently have any Schedule  
17 20 customers, or are any included in the 2023 test year?

18 A. No. While Idaho Power continues to respond  
19 to prospective customers that are exploring service under  
20 Schedule 20, there are no active customers taking service  
21 under Schedule 20, thus none were included in the 2023 test  
22 year.

23 Q. Please provide an update on any Schedule 20-  
24 related active Commission proceedings.

25 A. As directed by the Commission, on December

1 28, 2022, Idaho Power filed an Application recommending two  
2 proposals for the Commission's consideration on what, if  
3 any, compensation for mandatory interruption should be  
4 applicable to Schedule 20 customers.<sup>15</sup> The case is currently  
5 ongoing with a deadline for Staff and public comments of  
6 June 7, 2023, and a June 21, 2023, Company Reply Comment  
7 deadline.

8 Q. Is the Company proposing any changes to  
9 Schedule 20 rates as part of this GRC?

10 A. Yes. While the Company believes embedded  
11 rate components should remain based on underlying Schedule  
12 9 and 19 rates as designed until sufficient Schedule 20  
13 customers have joined Idaho Power's system to complete  
14 class-specific cost assignment, Idaho Power recommends  
15 updating the marginal energy component basis of Schedule  
16 20, and aligning to the time-of-use periods with those  
17 proposed for Schedule 9 and 19.

18 As recommended by Staff,<sup>16</sup> and adopted by the  
19 Commission,<sup>17</sup> the Company agreed<sup>18</sup> that evaluation and  
20 comparison of methods other than DSM Avoided Cost Averages

---

<sup>15</sup> *In the Matter of Idaho Power's Application for Authority to Establish Compensation for the Mandatory Interruption Requirement of Schedule 20 - Speculative High-Density Load*, Case No. IPC-E-22-30.

<sup>16</sup> *In the Matter of the Application of Idaho Power Company for Authority to Establish a New Schedule to Serve Speculative High-Density Load Customers*, Case No. 21-37, Staff Comments, p. 6.

<sup>17</sup> Case No. IPC-E-21-37, Order 35428, p. 7.

<sup>18</sup> Case No. IPC-E-21-37, Idaho Power Reply Comments, p. 5.

1 for setting the Schedule 20 energy rates should be  
2 completed prior to filing the Company's next (this) GRC. An  
3 evaluation is critical to ensure that referenced marginal  
4 prices best reflect costs the Company is actually incurring  
5 and are recovered through the PCA, which would not be  
6 collectable from Schedule 20 as the PCA rate does not apply  
7 to Schedule 20 energy sales priced at a marginal rate.

8 Idaho Power met with Staff on January 20, 2023, and  
9 again on February 2, 2023, to discuss the results of Idaho  
10 Power's evaluation and to solicit Staff's feedback.

11 Subsequent to the two discussions, Staff provided a memo,  
12 included as Exhibit No. 52, outlining five general criteria  
13 that should be considered when developing marginal cost-  
14 based customer energy rates:

- 15 • The resources used in a model for determining  
16 marginal cost should be based on the resources  
17 that are highly likely to exist during the rate  
18 period.
- 19 • The amount of incremental load used to  
20 determine the marginal cost rate should reflect  
21 the amount of incremental load for the portion  
22 of load that will be priced at marginal cost.
- 23 • The marginal cost rates should have enough  
24 granularity to reflect time difference (e.g.  
25 seasonality, time of day) value of Marginal

1 Cost within the Company's system to provide  
2 accurate price signals.

3 • If the marginal cost rates are based on a  
4 forecast, due to the lack of marginal costs  
5 being trued-up in the PCA, they should be  
6 updated often enough that they reflect current  
7 conditions or find a way to true up the  
8 marginal cost to actual marginal cost.

9 • If market costs are used, cost of transmission  
10 transaction and wheeling costs should be  
11 included.

12 Q. What marginal cost basis does Idaho Power  
13 propose for Schedule 20's energy rates?

14 A. In replacement of the current DSM Avoided  
15 Cost Average-based marginal rates, the Company proposes to  
16 use an AURORA-based method. This achieves several of the  
17 criteria noted in Staff's memo including granularity to  
18 reflect time differences, costs based on resources likely  
19 to exist during the rate period, and more frequent updates  
20 to reflect more current market conditions than DSM Avoided  
21 Cost Averages.

22 The marginal cost of energy is determined from the  
23 simulated hourly operation of the Company's power supply  
24 system over forecast hydro conditions. Net power supply  
25 expenses are first quantified using the Company's expected

1 load for the test year, then an incremental load increase  
2 is added to determine the resulting increase in power  
3 supply expenses and generation. The difference in monthly  
4 power supply expenses between the initial and subsequent  
5 simulation is divided by the difference in generation to  
6 produce a marginal cost per kWh.

7 Q. What are the resulting marginal energy  
8 rates, and at what interval does the Company propose to  
9 make updates?

10 A. The proposed seasonal, time-of-use marginal  
11 rates are as follows:

12 **TABLE 6**  
13 Proposed Seasonal - Time of use Marginal Rates

SONP (\$/kWh)	\$ 0.068108
SMP (\$/kWh)	\$ 0.095308
SOFP (\$/kWh)	\$ 0.050374
NSONP (\$/kWh)	\$ 0.048629
NSMP (\$/kWh)	\$ 0.068321
NSOFP (\$/kWh)	\$ 0.057180

14  
15 The Company proposes Schedule 20 energy rates be updated  
16 annually on June 1 using a forward test year consisting of  
17 the 12-month period April through the subsequent March,  
18 consistent with power cost spring filings.

19 Q. Does this conclude your direct testimony in  
20 this case?

21 A. Yes, it does.

**DECLARATION OF PAWEL P. GORALSKI**

I, Pawel P. Goralski, declare under penalty of perjury under the laws of the state of Idaho:

1. My name is Pawel P. Goralski. I am employed by Idaho Power Company as a Regulatory Consultant in the Regulatory Affairs Department.

2. On behalf of Idaho Power, I present this pre-filed direct testimony and Exhibit Nos. 36 through 52 in this matter.

3. To the best of my knowledge, my pre-filed direct testimony and exhibits are true and accurate.

I hereby declare that the above statement is true to the best of my knowledge and belief, and that I understand it is made for use as evidence before the Idaho Public Utilities Commission and is subject to penalty for perjury.

SIGNED this 1st day of June 2023, at Boise, Idaho.

Signed:   
PAWEL P. GORALSKI
