IDAHO POWER COMPANY

DIRECT TESTIMONY

OF

GRANT T. ANDERSON

1 Q. Please state your name, business address, and  
2 present position with Idaho Power Company ("Idaho Power" or  
3 "Company").

4 A. My name is Grant T. Anderson. My business address  
5 is 1221 West Idaho Street, Boise, Idaho, 83702. I am employed by  
6 Idaho Power as a Regulatory Consultant in the Regulatory Affairs  
7 Department.

8 Q. Please describe your educational background.

9 A. In May of 2013, I received a Bachelor of Science  
10 degree in Microbiology from Oregon State University. In May of  
11 2015, I earned a Master of Business Administration degree from  
12 Boise State University. In addition, I have attended the  
13 electric utility ratemaking course The Basics: Practical  
14 Regulatory Training for the Electric Industry, a course offered  
15 through New Mexico State University's Center for Public  
16 Utilities.

17 Q. Please describe your work experience with Idaho  
18 Power.

19 A. In 2018, I was hired as a Regulatory Analyst in the  
20 Company's Regulatory Affairs Department. My primary  
21 responsibilities as a Regulatory Analyst included supporting the  
22 Company's Commercial and Industrial customer classes' rate  
23 design and general support of tariff rules and regulations. In  
24 2021, I was promoted to my current position as a Regulatory  
25 Consultant. My responsibilities expanded to include the

1 development of complex cost-related studies and support of the  
2 Company's Residential and Small General Service ("R&SGS") and  
3 on-site generation customer classes' rate design.

4 Q. How is your testimony organized?

5 A. My testimony begins with an overview of the  
6 Company's modified project eligibility cap proposal for all non-  
7 legacy on-site customer generation systems. Next, I will provide  
8 an overview of the customer bill impact from the proposed change  
9 in the compensation structure. I will then address the Company's  
10 proposal for other implementation considerations, including  
11 recovery of export credit expenditures, billing and transfer  
12 criteria for net billing financial credits, conversion of  
13 accumulated kilowatt-hour ("kWh") credits to financial credits  
14 for customers with non-legacy systems, and customer education  
15 and outreach. I also address the Company's proposed tariff  
16 revisions related to the net billing compensation structure and  
17 interconnection requirements for systems under a modified  
18 project eligibility cap. Last, I will describe the Company's  
19 proposed annual Export Credit Rate ("ECR") update schedule.

20 Q. Have you prepared any exhibits?

21 A. Yes. My testimony includes Exhibit Nos. 6 - 8, which  
22 calculate the bill impact for non-legacy customer generators for  
23 the twelve months ending December 31, 2022, for residential,  
24 small commercial, and large commercial, respectively.

25 //

1 less than one-third of the energy a 25 kW system is expected to  
2 produce on average. Relative to the 25 kW cap, the average  
3 residential customer service point maximum annual hourly demand  
4 is approximately 6-7 kW. Additionally, the most commonly  
5 installed residential system is about 7.5 kW, or 30 percent of  
6 the 25 kW cap.

7 Q. Based on its analysis, is the Company proposing to  
8 modify the project eligibility cap for exporting systems under  
9 Schedules 6 and 8?

10 A. No. The data suggests the current cap is not  
11 limiting for residential and small general service customers and  
12 the Company believes the 25 kW cap continues to be reasonable  
13 for the administration of interconnection for service under  
14 Schedules 6 and 8.

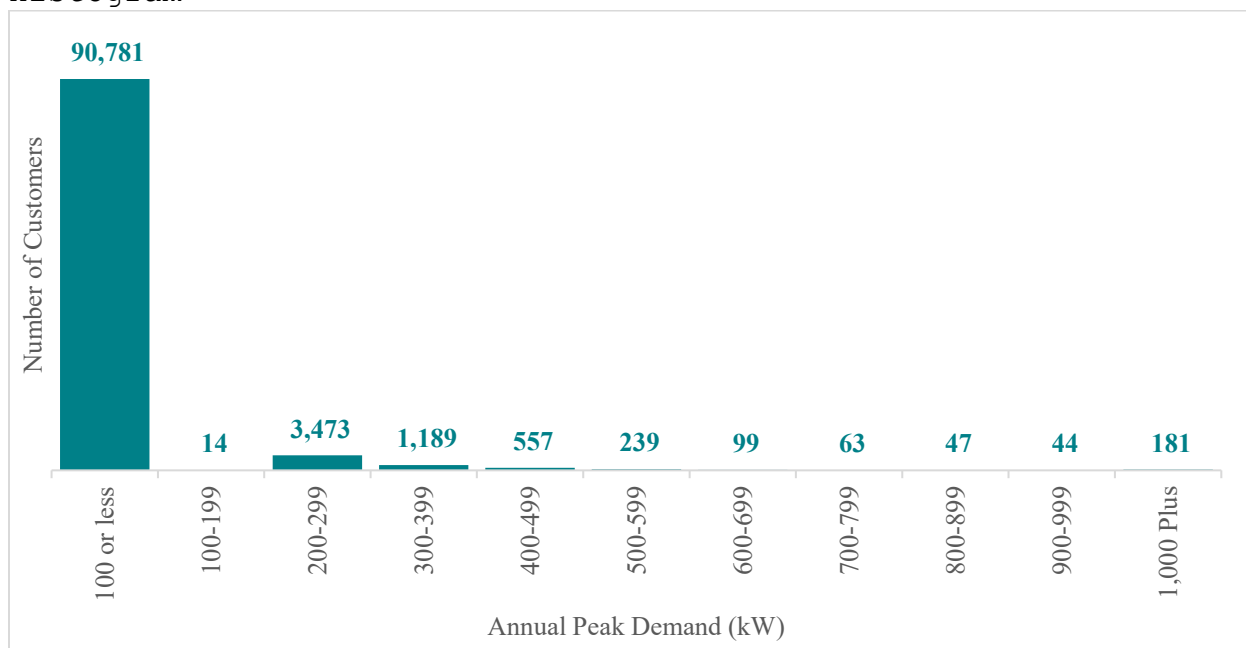

15 Q. What information did the Company rely on to  
16 evaluate whether the Schedule 84 cap continues to be reasonable?

17 A. The intent of net metering is to offset one's  
18 energy usage behind the meter. Therefore, the Company evaluated  
19 electrical demand by service point for non-solar commercial,  
20 industrial, and irrigation ("CI&I") service points.

21 Figure 1 is a histogram for all non-solar CI&I service  
22 points by annual demand. Figures 9.2 and 9.3 in the October 2022  
23 //

1 VODER Study<sup>2</sup> provide a more detailed breakdown of this same data  
2 by service point between commercial/industrial and irrigation  
3 customer service points.

4 **Figure 1**  
5 Non-Solar Commercial, Industrial, and Irrigation Service Point  
6 Histogram

7  
8  
9

Q. In your opinion, what are the key takeaways from  
10 this figure?

A. Generally, the cap is not limiting to the majority  
12 of customers at a given service point. Approximately six percent  
13 of CI&I service points registered an annual demand over 100 kW,  
14 with the remaining 94 percent registering a demand of 100 kW or  
15 less. While it may not appear to be limiting for the majority of

---

<sup>2</sup> See Attachment 1. See also, In the Matter of Idaho Power Company's Application to Complete the Study Review Phase of the Comprehensive Study of Costs and Benefits of On-Site Customer Generation & For Authority to Implement Changes to Schedules 6, 8, and 84, Case No. IPC-E-22-22, Attachment 1 (October 2022 VODER Study) to Idaho Power Company's Final Comments (Oct. 26, 2022).

1 customers, in the Company's experience customers who have some  
2 of those larger service point demands desire to install larger  
3 on-site generation systems. Rather than installing a system  
4 sized commensurate with their demand at a given site, those  
5 customers have had to rely on the Company's existing "meter  
6 aggregation rules" by installing smaller, disaggregated 100 kW  
7 systems. Those customers then apply annually to transfer kWh  
8 credits to qualifying service points.

9 Q. Based on its analysis, is the Company proposing to  
10 modify the project eligibility cap for Schedule 84?

11 A. Yes. The Company proposes that the project  
12 eligibility cap for Schedule 84 be set at the greater of 100 kW  
13 or 100 percent of demand at the service point.

14 Q. Please describe the relationship between customer  
15 and service point as it relates to administration of Idaho  
16 Power's tariff.

17 A. Often, the Company will refer to "customer" and  
18 "service point" synonymously when discussing a request for  
19 service. Each of Idaho Power's service schedules in its tariff -  
20 including the on-site generation schedules - are administered  
21 according to service point. A service point is akin to the point  
22 of delivery which is often the Company's meter.

23 Q. Did the Company consider a proposal that would have  
24 measured aggregate demand at a customer level versus service  
25 point?

1           A.       Yes. The Company considered aggregating demand by  
2 customer rather than service point but did not find that to be a  
3 feasible approach.

4           As I previously noted, the Company does not administer  
5 any of its tariff schedules based on aggregated service point  
6 data and the Company is concerned that introducing that  
7 requirement for the purpose of determining certain criteria only  
8 applicable to its on-site generation service schedules would  
9 lead to a burdensome administrative process that could be prone  
10 to error.

11           Decoupling the project eligibility cap from the service  
12 point will also create the potential for over-sized systems that  
13 could lead to distribution circuit upgrades solely to support  
14 on-site generation. While the on-site generation customer would  
15 be responsible for the initial cost of the upgrades, the ongoing  
16 cost, including maintenance, replacement, property taxes, and  
17 other ancillary costs will become the responsibility of the  
18 Company. These costs are collectively paid for by all customers.

19           Q.       How does the Company propose to measure demand for  
20 purposes of administering the cap?

21           A.       For customers with at least 12 months of historical  
22 billing data, the Company proposes using the maximum billing  
23 demand from the last 12 months, measured when the customer  
24 generation application is submitted - to establish a project  
25 eligibility cap.

1           For new customers, or those without at least 12 months of  
2 historical billing, the Company has identified a few methods for  
3 determining demand, depending on the circumstances. In the first  
4 instance, the Company will evaluate and rely on available  
5 historical billing data at that service location. For example,  
6 if a new customer assumes service at a service point that has  
7 historical usage, that historical usage could be relied upon. In  
8 the absence of that information, or in the case where a new  
9 customer believes their demand will exceed that of a past  
10 customer, the Company proposes requiring an analysis of the  
11 facility's power needs performed by a professional engineer.

12           For irrigation customers without a full in-season billing  
13 history, a conversion factor related to the horsepower of their  
14 pump(s) at the service point would determine the maximum demand.

15           Q.     Has the Company considered how it would administer  
16 a situation where a customer's demand decreases after the  
17 initial installation?

18           A.     Yes. The Company plans to determine the cap for the  
19 service point at the time of application. If the customer demand  
20 at the service point later decreases or a new customer takes  
21 over the premise with a lower power requirement, the Company  
22 does not propose the Commission require a change or reduction in  
23 the existing system size based on their new demand and power  
24 needs. Not only would tracking and managing changes be  
25 administratively burdensome, but it would have significant

1 impacts on the customer - most of which would undoubtedly be  
2 costly and would likely result in confusion and frustration.

3 Alternatively, if the customer's demand increases and  
4 they desire to interconnect a system expansion, this could be  
5 conducted pursuant to the existing interconnection requirements  
6 of Schedule 68, Interconnections to Customer Distributed Energy  
7 Resources ("Schedule 68") by applying for a system modification.

8 Q. Have other parties or customers taken a position on  
9 the project eligibility cap in previous dockets?

10 A. Yes. Clean Energy Opportunities for Idaho ("CEO")  
11 filed a petition in Case No. IPC-E-22-12, which proposed setting  
12 the project eligibility cap for Schedule 84 customers at 100  
13 percent of demand. The Idaho Irrigation Pumpers Association  
14 ("IIPA") did not support a change to the cap until changes to  
15 the compensation structure were approved by the Commission.<sup>3</sup> In  
16 context of discussing the project eligibility cap, the Idaho  
17 Public Utility Commission Staff ("Staff") acknowledged that  
18 subsidies exist under the current net energy metering ("NEM")  
19 framework.<sup>4</sup> Additionally, Staff stated that if the cap is  
20 increased before an avoided-cost-based ECR is implemented, it  
21 would result in more customer generation capacity being added  
22 with additional cost shifts to non-generating customers.<sup>5</sup> The

<sup>5</sup> *Id.*

1 Company has also heard anecdotally from its irrigation customers  
2 that a demand-based cap would be favorable.

3 Q. Does the Company believe its proposed modification  
4 to the project eligibility cap for non-legacy systems addresses  
5 concerns raised by customers and other stakeholders?

6 A. Yes. The Company believes this modification to the  
7 cap contingent upon the concurrent replacement of the existing  
8 NEM with a net billing compensation structure and an ECR based  
9 on avoided cost appropriately considers stakeholder feedback and  
10 will improve the service offering.

11 Q. Please explain whether the Company continues to  
12 have the concerns it raised previously about modifying the  
13 project eligibility cap under Schedule 84, and if not what has  
14 changed?

15 A. It does; however, these concerns are generally  
16 mitigated when evaluating all issues in this docket  
17 simultaneously. The primary purpose of the cap was to mitigate  
18 safety and reliability concerns. Mr. Jared Ellsworth's testimony  
19 addresses the requirements to ensure that all interconnected  
20 systems do not compromise safety and reliability. An additional  
21 rationale for the cap was to limit subsidies present as a result  
22 of NEM. In this docket, the Company has proposed modifying the  
23 measurement interval and ECR - the combination of which I will  
24 generally refer to as "compensation structure." The proposed  
25 compensation structure will better align cost recovery with

1 system utilization and compensation for excess energy with the  
2 costs and values of those activities. For these reasons, the  
3 Company proposes changes to both the compensation structure and  
4 the project eligibility cap occur coincidentally.

5 Q. Would the Company support a modification to the  
6 project eligibility cap under Schedule 84 absent a change to the  
7 compensation structure?

8 A. No. For the reasons I just mentioned, the Company  
9 believes the existing project eligibility cap mitigates some  
10 cost-shifting under the current retail rate NEM compensation  
11 structure. Therefore, the Company does not advocate changing the  
12 project eligibility cap without an avoided-cost-based rate for  
13 excess generation measured under a net billing compensation  
14 structure.

15 Q. Is the Company proposing modifications to the  
16 administration of how energy storage devices are applied to the  
17 project eligibility cap?

18 A. Yes. The Company is aware of limited circumstances  
19 where AC-coupled energy storage devices have resulted in a  
20 customer's proposed system to exceed the project eligibility  
21 cap. The Company proposes to modify its administration of the  
22 cap to only evaluate capacity of an energy storage device for  
23 purposes of its Feasibility Review to continue to ensure the  
24 interconnection does not impact safety or reliability of Idaho  
25 Power's system. However, for all future applications for

1 interconnection, an energy storage device would not count  
2 towards the capacity limits for applicability of exporting  
3 systems under Schedule 6, 8, and 84.Q. Are there other items  
4 that should be considered in relation to the Company's proposed  
5 modification to the project eligibility cap?

6 A. Yes. Mr. Ellsworth's testimony includes more detail  
7 about the interconnection requirements for customer-generators  
8 and the considerations associated with modifying the project  
9 eligibility cap for Schedule 84.

10 **II. COMPENSATION STRUCTURE & BILL IMPACT**

11 Q. Did the Company evaluate the impact on customer  
12 bills that will result with the change to a real-time net  
13 billing compensation structure?

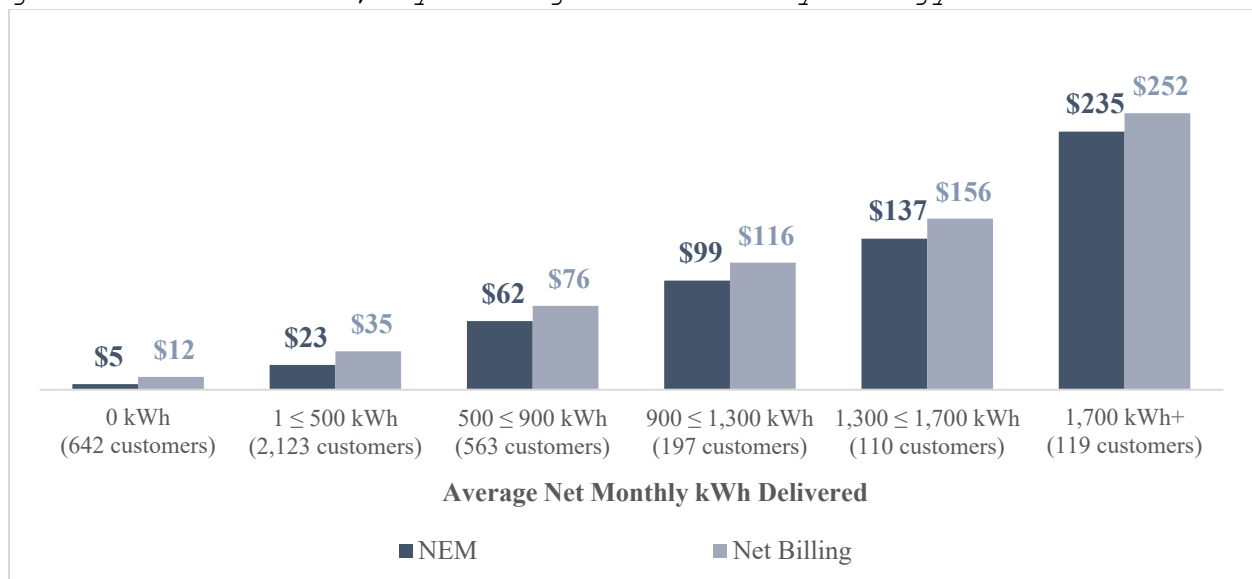

14 A. Yes. Included with my testimony are Exhibit Nos. 6-  
15 8, which summarize the bill impact for non-legacy on-site  
16 generation customers with billing data for the twelve months  
17 ending December 31, 2022.

18 Q. Please provide an overview of the results of the  
19 bill impact analysis.

20 A. There were approximately 3,750 non-legacy  
21 residential customers taking service under Schedule 6 for the  
22 twelve months ending December 31, 2022. Exhibit No. 6 summarizes  
23 the bill impact calculations for non-legacy Schedule 6 service  
24 points. The Company compared base rates under the existing NEM  
25 and proposed real-time net billing compensation structure. On an

1 average monthly basis, residential customer-generators monthly  
 2 bill under NEM was \$39.63 and under real-time net billing  
 3 increased to \$51.75, an average increase of \$12.12 per month.  
 4 Approximately 50 percent of customers would experience an  
 5 average monthly bill increase less than \$10 and 75 percent would  
 6 experience a bill increase less than \$15 per month.

7 **Figure 2**  
 8 Average monthly bill for non-legacy residential customer-  
 9 generators in 2022, by average net monthly energy use

10  
 11 Figure 2 separates the customer-generators by their  
 12 average monthly energy consumption in 2022 under a monthly  
 13 measurement interval. The residential customer-generators have  
 14 been grouped into six categories to evaluate the average  
 15 magnitude of bill impacts. Figure 2 does not account for the  
 16 residential customer-generators average monthly bill before

1 solar was installed, which, all else held equal, would have been  
2 higher than the real-time net billing average monthly bill.<sup>6</sup>

3 For the twelve months ending December 31, 2022, there  
4 were 13 non-legacy small general service customers and 8 non-  
5 legacy large commercial service customers taking service under  
6 Schedule 8 and Schedule 84, respectively. Exhibit Nos. 7 and 8  
7 summarize a similar analysis for these customers. There were no  
8 non-legacy irrigation customers taking service for the  
9 respective 12-month period.

10 Q. Did the Company consider implementing a transition  
11 period to mitigate customer impacts associated with a modified  
12 ECR?

13 A. Yes. Ms. Aschenbrenner's testimony addresses the  
14 Company's evaluation of a transition plan, which considered the  
15 results of the bill impact analysis.

16 **III. IMPLEMENTATION CONSIDERATIONS**

17 Q. What implementation considerations and  
18 recommendations are included in the Company's proposal?

19 A. In Order No. 35631, the Commission stated that the  
20 October 2022 VODER Study complied with its previous directives  
21 and should serve as a basis for the Company's implementation  
22 recommendation in a subsequent case.<sup>7</sup> Ms. Aschenbrenner's  
23 testimony addresses the Company's proposal to utilize a real-

---

<sup>6</sup> Attachment 1 at 94-95, Figures 6.1 and 6.2.

<sup>7</sup> Case No. IPC-E-22-22, Order No. 35631 at 28 (Dec. 19, 2022).

1 time measurement interval for the compensation structure and Mr.  
2 Ellsworth's testimony addresses the methods the Company has  
3 proposed for the valuation of the ECR. In this section, I will  
4 address the following implementation considerations: (1)  
5 recovery of ECR expenditures; (2) application of financial  
6 credits for billing items and transfer criteria, (3) conversion  
7 of accumulated kWh credits to financial credit, and (4) customer  
8 education and outreach.

9 Q. Do these implementation considerations impact  
10 customers with legacy systems?

11 A. No. The proposed on-site generation compensation  
12 structure changes would only apply to customers with non-legacy  
13 systems. As a result, customers with legacy systems will  
14 continue to take service under the rules of NEM until legacy  
15 status terminates. Therefore, these implementation  
16 considerations do not impact customers with legacy systems.

17 **Recovery of Export Credit Expenditures**

18 Q. Please describe the Company's recommendation  
19 related to recovering export credit expenditures.

20 A. For customers with non-legacy systems, the Company  
21 proposes to treat the ECR expenditures as a net power supply  
22 expense ("NPSE") subject to 100 percent recovery through the  
23 Power Cost Adjustment ("PCA"), similar to the practice for  
24 Public Utility Regulatory Policies Act of 1978 ("PURPA")  
25 Qualifying Facilities ("QF"). The October 2022 VODER Study

1 evaluates recovering export credit expenditures in Section 8  
2 (pages 115-117).

3 Q. Why is it appropriate to recover the cost of ECR  
4 expenses through the PCA?

5 A. ECR expenses represent the cost of energy that the  
6 Company is purchasing for the benefit of all of its customers.  
7 Therefore, it is reasonable for all customers to pay for that  
8 energy through the PCA. Prior to 2014, net metering customers  
9 were compensated for their net excess generation through  
10 financial credits, the cost of which were recovered through the  
11 PCA.<sup>8</sup>

12 Q. Why is it appropriate that ECR expenditures be  
13 recovered through the PCA at 100 percent not subject to the 95  
14 percent/5 percent sharing mechanism?

15 A. The Energy Policy Act of 2005 amended Section 111  
16 of PURPA by adding five new federal ratemaking standards for  
17 electric utilities. Notably, however, many of the basic concepts  
18 embodied in the "new" federal standards were not new in Idaho.  
19 For example, in considering the amendments to PURPA the  
20 Commission concluded that the federal net metering standard,  
21 which required electric utilities to make available upon request  
22 a service offering under which a customer could offset their

---

<sup>8</sup> *In the Matter of the Application of Idaho Power Company for Authority to Implement a Power Cost Adjustment (PCA) Rate for Electric Service from May 16, 2003 through May 15, 2004, Case No. IPC-E-03-05, Exhibit No. 3 to Direct Testimony of Gregory W. Said (Apr. 15, 2003).*

1 energy usage with their own generation, had already been  
2 implemented in Idaho.<sup>9</sup> Regardless, similar to resources a utility  
3 is forced to acquire under federal law, which the Commission has  
4 allowed the Company 100 percent recovery of since the PCA was  
5 established in 1983,<sup>10</sup> customer-generator exports have become a  
6 must-take resource at the state level and as such 100 percent of  
7 ECR expenditures should be recovered through the PCA. In all  
8 other instances where the Company is required to make payments  
9 at prices consistent with Commission order, such as demand  
10 response and PURPA, those payments are recovered at 100 percent.

11 **Financial Credits - Billing and Transfer Criteria**

12 Q. Please describe the Company's recommendation for  
13 how it proposes to apply financial credits to the bill.

14 A. The Company proposes that financial credits offset  
15 all billing components of the bill - not just the energy-related  
16 portion of a customer bill.

17 Q. Does the Company propose that financial credits  
18 could be transferred to other meters or service points?

19 A. Yes, for customers with non-legacy systems the  
20 Company proposes that a customer could transfer financial  
21 credits to another account held in their name for their own

---

<sup>9</sup> *In the Matter of the Commission's Consideration of the Five Amendments to Section 111 of PURPA Contained in the Energy Policy Act of 2005*, Case No. GNR-E-06-02, Order No. 30229 at 3-5 (Jan. 24, 2007).

<sup>10</sup> *In the Matter of the Application of Idaho Power Company for Authority to Implement a Power Cost Adjustment Tariff for Electric Service to Customers in the State of Idaho and for Approval of New Rates for Service Under the FMC Special Contract*, Case No. IPC-E-92-25, Order No. 24806 at 17 (Mar. 29, 1993).

1 usage. Financial credits would be non-transferrable in the event  
2 the customer relocates and/or discontinues service at the point  
3 of delivery associated with the exporting system. Any unused  
4 financial credit from discontinued service would be absorbed to  
5 the benefit of customers through a credit, or reduction, to the  
6 PCA.

7 Q. How would the transfer of excess financial credits  
8 be administered?

9 A. Idaho Power proposes that the transfer of excess  
10 financial credits be administered similar to its current NEM  
11 service offering for customers transferring kWh credits.

12 Customers would submit requests to transfer financial  
13 credits by January 31. After reviewing the eligibility of each  
14 request, Idaho Power would execute approved transfers no later  
15 than March 31. Between the time forms are submitted by the  
16 January deadline and the transfers are executed in March, energy  
17 generation and consumption will continue to occur, impacting the  
18 available balance of financial credits. Therefore, customers  
19 would be asked to specify a percent of financial credits to  
20 transfer rather than an actual dollar amount. Transfers would be  
21 limited to other accounts in the customer's name and customers  
22 would be asked to attest that the account they are transferring  
23 credits to is for their own usage. Like the current NEM  
24 offering, there would be a \$10 charge per meter receiving the  
25 credit.

1 Q. Did the Company identify any potential concerns  
2 with the proposed transfer of financial credits?

3 A. Yes. The Company does not have the ability to  
4 validate that the account where credits would be transferred is  
5 for the customer's own usage, and therefore proposes to rely on  
6 an attestation from the customer. The potential for gaming  
7 exists if a customer were to put accounts in their name where  
8 the usage was not for their own use. The same risk factor exists  
9 under the Commission-approved rules for legacy transfer of kWh  
10 credits and the Company believes this risk is in part mitigated  
11 by the adoption of a project eligibility cap based on the demand  
12 at the service point.

13 Q. Is the Company proposing to change the  
14 transferability of kWh credits for legacy customers?

15 A. No. In Order No. 32925, the Commission granted  
16 limited transferability of kWh credits. In part, the Commission  
17 found that:

18 As discussed in prior comments and testimony,  
19 even with one delivery point, net metering  
20 customers may not pay their full fixed costs  
21 given the current rate structure. We find that  
22 allowing customers to apply credits to offset  
23 usage on continuous meters that are served by  
24 the same primary feeder is a reasonable means  
25 by which to limit the potential under-recovery  
26 of fixed costs.

27 To the extent a legacy on-site generation customer wishes  
28 to transfer financial credits to service points not eligible  
29 under the rules applicable to legacy systems, that customer can

1 elect to forfeit legacy status. The Customer will take service  
2 under the modified on-site generation offering, which will  
3 include the flexibility to transfer credits more broadly than  
4 what was allowed under NEM.

5 **Accumulated kWh Credit Conversion - Non-Legacy Customers**

6 Q. How does the Company propose to treat kWh credits  
7 that were accumulated prior to the proposed January 1, 2024,  
8 effective date?

9 A. The Company proposes that accumulated kWh credits  
10 held at service points with non-legacy systems be converted to  
11 financial credits one year after the effective date of a  
12 Commission-authorized change in compensation structure.

13 Q. Please describe the Company's recommendation  
14 related to the conversion of accumulated kWh credits for  
15 customers with non-legacy systems.

16 A. Customers with non-legacy systems would have had  
17 the opportunity to accumulate kWh credits from the time they  
18 interconnected their system. If the Company's proposal is  
19 approved, these customers would begin receiving financial  
20 credits that could be monetized when they have billable amounts  
21 to offset.

22 The Company proposes that these customers have one year  
23 after moving to the net billing compensation structure to use

1 their pre-existing kWh credit balance from NEM.<sup>11</sup> Any remaining  
2 kWh credits that have not been used by the customer would be  
3 converted to a financial credit on their January 2025 billing  
4 cycle.

5 Q. How does the Company propose for kWh credits to  
6 convert to a financial credit balance?

7 A. The Company proposes monetization into a financial  
8 credit balance at the blended average retail energy rate as of  
9 December 31, 2023, for the respective customer class under which  
10 they take retail service from Idaho Power. These credits were  
11 generated under the NEM compensation structure and to avoid  
12 retroactive ratemaking, Idaho Power believes it is reasonable to  
13 assume they would have monetized the credits at the applicable  
14 blended average energy retail rate in effect while NEM was in  
15 place. The final kWh credits will be applied prior to the  
16 customer's January billing cycle.

17 Q. Did the Company consider allowing accumulated kWh  
18 credits to continue to be used to offset energy usage beyond one  
19 year after implementation of a change in the compensation  
20 structure?

21 A. Yes. However, to facilitate the transition from NEM  
22 with a one-for-one kWh credit to a net billing financial credit

---

<sup>11</sup> Pursuant to the existing Conditions of Purchase and Sale in Schedule 6, 8, and 84, the Company will process Excess Net Energy (kWh) credit transfer requests from non-legacy customer-generators in January 2024 and requests to transfer financial credits will occur December 2024 - January 2025.

1 approach, the Company suggests converting the kWh credits to  
2 financial credits one year after the effective date of net  
3 billing to reduce administrative burden and possible customer  
4 confusion associated with carrying two separate credit balances.  
5 The Company also believes one year post-implementation of a  
6 change in the compensation structure gives customers time to use  
7 remaining kWh credit balances.

8 Q. How does the Company propose the cost of these  
9 financial credits be recovered?

10 A. Under the existing NEM policy, if the accumulated  
11 kWh credits were used to offset usage, the cost to R&SGS  
12 customers would primarily be recovered from R&SGS customers  
13 through the Fixed Cost Adjustment ("FCA") mechanism. To maintain  
14 consistency with the current recovery method, the Company  
15 believes it is reasonable to recover the transition cost of  
16 converting the accumulated kWh credits to financial credits from  
17 R&SGS customers through a one-time adjustment to the FCA balance  
18 as of December 31, 2024, which would then be collected in FCA  
19 rates from June 1, 2025, through May 31, 2026.

20 In the event there are any remaining accumulated kWh  
21 credits for CI&I customers as of December 31, 2024, the Company  
22 believes it is reasonable to recover the transition cost of  
23 converting those accumulated kWh credits to financial credits  
24 through the PCA.

1 For context, as of December 31, 2022, there were  
2 approximately 4.7 million non-legacy accumulated kWh credits -  
3 the vast majority being residential - which, valued at the then-  
4 current blended average energy rate was approximately \$496,000.

5 **Customer Outreach and Education**

6 Q. Please explain how the Company will notify  
7 customers about its proposal in this docket.

8 A. Coincident with filing this docket, Idaho Power  
9 will issue a news release to notify the public of its  
10 Application. Additionally, Idaho Power will directly notify its  
11 customers of the Application with a bill insert included with  
12 their monthly bill. The bill insert will inform all customers  
13 that Idaho Power has filed a case requesting changes to the  
14 structure and design of its on-site generation offering with a  
15 requested effective date of January 1, 2024. A copy of the press  
16 release and customer bill insert is included as Attachment 4 to  
17 the Application.

18 Q. How will the Company notify existing and pending  
19 on-site generation customers of the filing?

20 A. In addition to providing a bill insert to all  
21 customers under the major customer classes, the Company will  
22 send direct-mail letters to all existing and pending on-site  
23 generation customers notifying them that the Company has filed  
24 its proposal for changes informed by the Commission-acknowledged  
25 VODER Study. The letters that customers with legacy systems

1 receive will also remind them of their legacy status, the  
2 criteria for legacy systems, and the reasons legacy status may  
3 be forfeited. The letter that customers with non-legacy systems  
4 receive will advise them on how they may be impacted by the  
5 outcome of the case. All existing and pending on-site generation  
6 customers, irrespective of the legacy status of their system,  
7 will receive information on how they can participate in the  
8 proceeding. A copy of the draft customer letters is included as  
9 Attachment 5 to the Application.

10 In addition, the Company will have information available  
11 on its website, and customers may contact the Customer Service  
12 Center with questions about the filing.

13 Q. Has the Company considered how it would educate  
14 existing non-legacy customers about the new compensation  
15 structure once it is changed?

16 A. Yes. The Company has considered modifications to  
17 customer bill presentment for printed and online bills, as well  
18 as modifications to usage and billing information presented  
19 through the Company's MyAccount online and mobile app.  
20 Implementing bill and usage presentation changes will provide  
21 pertinent details to existing customers to help them better  
22 understand how they are billed under real-time net billing.

23 Q. What information will Idaho Power make available to  
24 prospective on-site generation customers who seek information  
25 about how an installation may impact their Idaho Power bill?

1           A.       Customers can access their historical hourly grid  
2 consumption data through an online portal or by calling the  
3 Customer Service Center. Additionally, generation system hourly  
4 production estimates are publicly available from sources such as  
5 the National Renewable Energy Laboratory's PV Watts® Calculator  
6 or the customer's installer. Customers can pair their grid  
7 consumption data from Idaho Power with the generation system  
8 production data to evaluate the potential economics of  
9 installing on-site generation.

10           Idaho Power also understands that its customers are  
11 considering considerable investments and strives to provide  
12 tools to them where possible. For residential and small general  
13 service customers, Idaho Power plans to provide its customers  
14 access to a third-party calculator tool on Idaho Power's  
15 website. The calculator will provide the option to use uploaded  
16 hourly consumption data in calculations, or a customer can use  
17 an estimate of their monthly electric costs if they don't have  
18 twelve months of billing history, or an average electric bill if  
19 they have no billing history. For CI&I customers, Idaho Power's  
20 Energy Advisors, and Agriculture Representatives will continue  
21 to make additional information available to its customers.

22           Q.       In your opinion, does the Company's plan for  
23 customer communication and outreach position it to successfully  
24 implement a net billing compensation structure?

1           A.       Yes. Idaho Power's customer relations teams have  
2 been thorough and diligent in developing communication  
3 strategies and evaluating the option to make a calculator tool  
4 available to its customers. Customers can understand real-time  
5 net billing, and it is the most accurate and fair measurement of  
6 energy flows to and from the customer.

7           The Company endeavors to properly notify all current and  
8 prospective on-site generation customers of its proposed changes  
9 by sending direct-mail letters and bill inserts. Post-  
10 implementation, it is also critical to the long-term success of  
11 the on-site generation service offering that Idaho Power provide  
12 consumption and export information that allows existing  
13 customers to understand the bi-directional relationship and  
14 impacts on billing. Additionally, prospective on-site generation  
15 customers need access to the necessary data and tools to make  
16 the most informed and decision based on accurate information -  
17 while understanding that the Company's tariff is subject to  
18 change. Idaho Power's plans for customer communication, billing  
19 presentment, and a calculator tool will facilitate a successful  
20 shift towards an improved and modernized compensation structure  
21 for on-site customer generation.

22                           **IV. PROPOSED TARIFF REVISIONS**

23           Q.       What tariff revisions are necessary to implement  
24 the Company's proposal?

1           A.       Revisions to Schedules 6, 8, 68, and 84 are  
2 necessary to implement the proposed changes in this docket. The  
3 Company has included its proposed tariff revisions in Attachment  
4 2 to the Application in this docket.

5           Q.       Please explain what tariff revisions the Company  
6 has proposed for Schedules 6 and 8.

7           A.       The Company has included tariff revisions to  
8 reflect the change in compensation structure for non-legacy  
9 systems from NEM to real-time net billing. The tariff revisions  
10 lay out the compensation structure that would be separately  
11 applicable to customers with legacy and non-legacy systems. The  
12 "conditions to purchase and sale" have been separated into three  
13 sections. The first are those provisions that only apply to  
14 legacy systems under the NEM compensation structure and the  
15 second are those provisions that only apply to non-legacy  
16 systems under the proposed net billing compensation structure.  
17 The third section includes provisions that broadly apply to all  
18 customers taking service under Schedule 6 and 8. The revised  
19 tariff also includes line items for the ECR applicable to non-  
20 legacy systems, and specifies the proposed change in the  
21 administration of energy storage devices towards the 25 kW cap.  
22 Finally, the Company has proposed a few minor operational  
23 administrative items.

24           Q.       Please summarize the revisions the Company has  
25 proposed for Schedule 84.

1           A.       The proposed revisions to Schedule 84, similar to  
2 those for Schedules 6 and 8, account for a modification to the  
3 service offering from NEM to real-time net billing for customers  
4 with non-legacy systems and the administration of energy storage  
5 devices. In addition, the revisions to Schedule 84 define the  
6 modification to the project eligibility cap for non-legacy  
7 systems.

8           Q.       What revisions has the Company proposed for  
9 Schedule 68?

10          A.       As more fully explained in Mr. Ellsworth's  
11 testimony, the Company has included modifications to update the  
12 interconnection requirements for Schedule 84 customers that  
13 install systems larger than 100 kW. Schedule 68 also reflects  
14 minor administrative updates for the interconnection process.

15                   **V.    PROPOSED SCHEDULE FOR ECR UPDATES**

16          Q.       Mr. Ellsworth's testimony describes the Company's  
17 proposed methodology for establishing an ECR and methods the  
18 Company is proposing for valuing each of the components of the  
19 ECR. What is the Company's proposed timing and frequency for  
20 updating the ECR?

21          A.       The Company recommends an annual ECR update filed  
22 in April, where Commission-approved updates would take effect  
23 June 1 each year, concurrent with other spring filing and  
24 seasonal rate changes. The primary driver for the proposed  
25 update schedule is to ensure that Energy Imbalance Market Load

1 Aggregation Point ("ELAP") hourly prices have been disputed and  
2 reconciled. The Company also believes it is important from a  
3 timing perspective to have the effective ECR changes occur in  
4 June in advance of the summer season.

5 Q. Please describe the Company's proposed update cycle  
6 for each of the respective methods and components of the ECR.

7 A. The Company has identified updates for the proposed  
8 methods as fitting into two general categories: (1) annual  
9 updates, and (2) routine updates less frequent than annual. The  
10 routine updates that are less frequent than annual are informed  
11 by other filings or studies, such as Idaho Power's Integrated  
12 Resource Plan ("IRP"). Table 1 provides a summary of each of the  
13 inputs to the ECR and the proposed update cadence. Annual  
14 updates will rely on data from the most recent twelve months  
15 ending December 31 and routine updates will rely on the most  
16 recently available information at the time of its annual filing  
17 to update the ECR.

18 //

19

20

21

22

23

24

25

1 **Table 1**  
 2 ECR Proposed Update Schedule by Input

<b>Input</b>	<b>ECR Component</b>	<b>Type of Update</b>
<b>Real-Time Exports</b> <i>12 months ending Dec 31</i>	Avoided Energy; Avoided Generation Capacity	Annual
<b>ELAP Hourly Market Prices</b> <i>12 months ending Dec 31</i>	Avoided Energy	Annual
<b>Contribution Capacity - ELCC</b> <i>3-year rolling average</i>	Avoided Generation Capacity	Annual
<b>Peak Annual Exports</b> <i>Total MW</i>	Avoided Generation Capacity	Annual
<b>Levelized Cost of Avoided Resource</b> <i>Cost per kW-year</i>	Avoided Generation Capacity	Routine - Most recently filed IRP
<b>Hours of Capacity Need</b> <i>On-Peak Hours</i>	Avoided Energy; Avoided Generation Capacity	Routine - Most recently filed IRP
<b>Transmission &amp; Distribution Deferral</b> Annual Deferral Value	Avoided Transmission & Distribution Capacity	Routine - Most recently filed IRP
<b>Line Loss Study</b> <i>Loss Coefficients</i>	Avoided Line Losses	Routine - Updated with periodic line loss study
<b>Variable Energy Resource Integration Study</b>	Integration Costs	Routine - Updated with periodic VER Study

3  
 4 Q. How does the Company propose to update the avoided  
 5 energy component of the ECR?

6 A. The avoided energy value would be updated annually  
 7 using the most recent 12 months, ending December 31, for both  
 8 customer-generator exports and ELAP prices. ELAP hourly settled  
 9 price corrections are typically available within approximately  
 10 60 days - this timing, in part, drives the Company's proposed  
 11 update schedule to file in April of each year.

12 Q. How does the Company propose to update the avoided  
 13 generation capacity component of the ECR?

14 A. The avoided generation capacity calculation would  
 15 be updated annually to reflect real-time customer exports and

1 peak annual export for the most recent calendar year. As  
2 described by Mr. Ellsworth, the ECR would utilize a three-year  
3 rolling average ELCC calculation to mitigate year-to-year  
4 volatility. The annual update would rely on the most-recently  
5 filed IRP for defining the on-peak hours and the value of the  
6 levelized cost of the avoided resource.

7 Q. Please describe how the Company plans to update the  
8 T&D capacity value.

9 A. The annual update for the T&D capacity value  
10 component of the ECR will reference the most recently filed IRP.  
11 The calculation of the T&D capacity value relies on the same 20  
12 years of project data that are used to determine IRP energy  
13 efficiency values. This data includes 15 years of historical  
14 data and 5 years of projected data.

15 Q. How does the Company propose to update the avoided  
16 line loss value to inform the proposed annual ECR updates?

17 A. The annual update for the ECR will rely on the most  
18 recently completed line loss study. Line loss studies are  
19 comprised of extensive analyses and are not performed on a  
20 frequent basis; however, line losses are expressed as  
21 percentages, which do not significantly vary over time.  
22 Therefore, the periodic update of the input is reasonable and  
23 will not negatively impact customer-generators or non-  
24 participants.

1 Q. How does the Company propose to update the  
2 integration costs in the ECR annual update?

3 A. The annual ECR update will rely on the most  
4 recently completed VER Integration Study. As explained in Mr.  
5 Ellsworth's testimony, integration studies are completed  
6 periodically, based on current and expected variable non-  
7 dispatchable resources on the Company's system. The annual  
8 update would incorporate updated integration costs into the ECR  
9 in the annual update subsequent to completion of the next VER  
10 Integration Study.

11 **VI. CONCLUSION**

12 Q. Does the Company's proposal to modify the Schedule  
13 84 project eligibility cap, other implementation considerations,  
14 and the proposed schedule for ECR updates meet the Company's  
15 primary objectives in this case?

16 A. Yes. The Company's objectives provide the  
17 foundation for proposing changes to the project eligibility cap  
18 and excess energy transfer process that will provide additional  
19 flexibility and opportunities for customers to install on-site  
20 generation. The proposed schedule for ECR updates is repeatable  
21 and will ensure timely recognition of changing conditions on  
22 Idaho Power's system and the broader power markets. Last, the  
23 proposed tariff revisions and planned customer education and  
24 outreach regarding a change to a net billing compensation  
25 structure provide for enhanced customer understandability.

1 Q. Does this conclude your testimony?

2 A. Yes.
