QUALIFICATIONS OF ADRIEN M. MCKENZIE

1 What is the purpose of this exhibit? Q. 2 This exhibit describes my background Α. and 3 experience and contains the details of my qualifications. 4 Q. Please describe your qualifications and 5 experience. 6 I received B.A. and M.B.A. degrees with a major Α. 7 in finance from The University of Texas at Austin, and hold 8 the Chartered Financial Analyst (CFA®) designation. Since 9 joining FINCAP in 1984, I have participated in consulting 10 assignments involving a broad range of economic and 11 financial issues, including cost of capital, cost of 12 service, rate design, economic damages, and business 13 valuation. I have extensive experience in economic and 14 industries, financial analysis for requlated in and 15 preparing and supporting expert witness testimony before 16 courts, regulatory agencies, and legislative committees 17 throughout the U.S. and Canada. Since 2014, I have 18 personally sponsored direct and rebuttal testimony 19 concerning the rate of return on equity ("ROE") in 20 proceedings filed with the Federal Energy Regulatory 21 Commission ("FERC" or "the Commission"), the Hawaii Public Exhibit No. 3 Case Nos. AVU-E-15-05/AVU-G-15-01

Nos. AVU-E-15-05/AVU-G-15-01 A. McKenzie, Avista Schedule 1, Page 1 of 6

1 Utilities Commission, the Kansas State Corporation 2 Commission, the Kentucky Public Service Commission, the 3 Montana Public Service Commission, the Public Utility Commission of Oregon, the South Dakota Public Utilities 4 5 Commission, the Washington Utilities and Transportation 6 Commission, and the Wyoming Public Service Commission. My 7 testimony addressed the establishment of risk-comparable 8 proxy groups, the application of alternative quantitative 9 methods, and the consideration of regulatory standards and 10 policy objectives in establishing a fair ROE for regulated 11 electric and gas utility operations.

12 In addition, over the course of my career I have worked with Dr. William Avera to prepare prefiled direct 13 14 and rebuttal testimony in over 250 regulatory proceedings before the Federal Energy Regulatory Commission ("FERC") 15 16 (including Docket No. EL11-66-001, which established FERC's 17 current policies with respect to ROE for electric utilities, adopted in Opinion No. 531), the Canadian Radio-18 19 Television and Telecommunications Commission, and regulatory agencies in over 30 states.¹ In connection with 20 21 these assignments, my responsibilities have included 22 performing analyses to estimate investors' required rate of

¹ This testimony was sponsored by Dr. William Avera, who is President of FINCAP, Inc.

1 return, critically evaluating the results of alternative 2 approaches, evaluating the positions of other parties, 3 representing clients in settlement negotiations and 4 hearings, and assisting in the preparation of legal briefs. 5 Prior to joining FINCAP, I was employed by an oil and gas 6 firm and was responsible for operations and accounting. A 7 resume containing the details of my qualifications and 8 experience is attached below.

ADRIEN M. McKENZIE

Vice President FINCAP, INC. Financial Concepts and Applications *Economic and Financial Counsel* 3907 Red River Austin, Texas 78751 (512) 458–4644 FAX (512) 458–4768 fincap3@texas.net

Summary of Qualifications

Adrien McKenzie has an MBA in finance from the University of Texas at Austin and holds the Chartered Financial Analyst (CFA) designation. He has over 25 years of experience in economic and financial analysis for regulated industries, and in preparing and supporting expert witness testimony before courts, regulatory agencies, and legislative committees throughout the U.S. and Canada. Assignments have included a broad range of economic and financial issues, including cost of capital, cost of service, rate design, economic damages, and business valuation.

Employment

Consultant, FINCAP, Inc. (June 1984 to June 1987) (April 1988 to present) Economic consulting firm specializing in regulated industries and valuation of closely-held businesses. Assignments have involved electric. gas, telecommunication, and water/sewer utilities, with clients including utilities, consumer groups, municipalities, regulatory agencies, and cogenerators. Areas of participation have included rate of return, revenue requirements, rate design, tariff analysis, avoided cost, forecasting, and negotiations. Develop cost of capital analyses using alternative market models for electric, gas, and telephone utilities. Prepare prefiled direct and rebuttal testimony, participate in settlement negotiations, respond to interrogatories, evaluate opposition testimony, and assist in the areas of cross-examination and the preparations of legal briefs. Other assignments have involved preparation of technical reports, valuations, estimation of damages, industry studies, and various economic analyses in support of litigation.

Manager, McKenzie Energy Company (Jan. 1981 to May. 1984) Responsible for operations and accounting for firm engaged in the management of working interests in oil and gas properties.

Education

<i>M.B.A., Finance</i> , University of Texas at Austin (Sep. 1982 to May. 1984)	Program included coursework in corporate finance, accounting, financial modeling, and statistics. Received Dean's Award for Academic Excellence and Good Neighbor Scholarship.
	Professional Report: <i>The Impact of Construction</i> <i>Expenditures on Investor-Owned Electric Utilities</i>
<i>B.B.A., Finance,</i> University of Texas at Austin (Jan. 1981 to May 1982)	Electives included capital market theory, portfolio management, and international economics and finance. Elected to Beta Gamma Sigma business honor society. Dean's List 1981-1982.
Simon Fraser University, Vancouver, Canada and University of Hawaii at Manoa, Honolulu, Hawaii (Jan. 1979 to Dec 1980)	Coursework in accounting, finance, economics, and liberal arts.
(Juli 1979 to Dec 1900)	

Professional Associations

Received Chartered Financial Analyst (CFA) designation in 1990.

Member – CFA Institute.

Representative Assignments

Mr. McKenzie has prepared and supported prefiled testimony submitted in over 250 regulatory proceedings. In addition to filings before regulators in 33 states, Mr. McKenzie has considerable expertise in preparing expert analyses and testimony before the Federal Energy Regulatory Commission ("FERC") on the issue of ROE. Many of these proceedings have been influential in addressing key aspects of FERC's policies with respect to ROE determinations. Broad experience in applying and evaluating the results of quantitative methods to estimate a fair ROE, including discounted cash flow approaches, the Capital Asset Pricing Model, risk premium methods, and other quantitative benchmarks. Other representative assignments have included the application of econometric models to analyze the impact of anti-competitive behavior and estimate lost profits; development of explanatory models for nuclear plant capital costs in connection with prudency reviews; and the analysis of avoided cost pricing for cogenerated power.

I. DESCRIPTION OF QUANTITATIVE ANALYSES

1 Q. What is the purpose of this schedule? 2 Exhibit No. 3, Schedule 2 presents capital Α. 3 market estimates of the cost of equity. First, I examine 4 the concept of the cost of equity, along with the riskreturn tradeoff principle fundamental to capital markets. 5 Next, I describe DCF, ECAPM, and risk premium analyses б conducted to estimate the cost of equity for reference 7 8 groups of comparable risk firms. This schedule also 9 presents alternative tests to confirm that the end-results 10 of my primary analyses are reasonable and do not exceed a 11 fair ROE.

A. Comparable Risk Proxy Group

12 How did you implement quantitative methods to ο. 13 estimate the cost of common equity for Avista? 14 Α. Application of quantitative methods to estimate 15 the cost of equity requires observable capital market 16 data, such as stock prices. Moreover, even for a firm 17 with publicly traded stock, the cost of equity can only be 18 estimated. As a result, applying quantitative models 19 using observable market data only produces an estimate that inherently includes some degree of observation error. 20

> Exhibit No. 3 Case Nos. AVU-E-15-05/AVU-G-15-01 A. McKenzie, Avista Schedule 2, Page 1 of 47

1 Thus, the accepted approach to increase confidence in the 2 results is to apply the quantitative methods such as the 3 DCF and ECAPM to a proxy group of publicly traded 4 companies that investors regard as risk-comparable. 5 Q. What specific proxy group of utilities did you б rely on for your analysis? 7 In order to reflect the risks and prospects Α. associated with Avista's jurisdictional utility 8 9 operations, my DCF analyses focused on a reference group 10 of other utilities composed of those companies included by The Value Line Investment Survey ("Value Line") in its 11 12 Electric Utilities Industry groups with: 13 1. S&P corporate credit ratings of BBB-, BBB, or 14 BBB+; 15 2. Moody's issuer ratings of Baa2, Baa1, or A3, 3. Value Line Safety Rank of "2" or "3"; 16 17 4. No involvement in a major merger or acquisition; 18 and, 19 5. Currently paying common dividends with no recent 20 dividend cuts. 21 These criteria resulted in a proxy group composed of 19 22 companies, which I refer to as the "Utility Group."

> Exhibit No. 3 Case Nos. AVU-E-15-05/AVU-G-15-01 A. McKenzie, Avista Schedule 2, Page 2 of 47

Q. How did you evaluate the risks of the Utility Group relative to Avista?

My evaluation of relative risk considered four 3 Α. 4 objective, published benchmarks that are widely relied on 5 in the investment community. Credit ratings are assigned by independent rating agencies for the purpose of 6 providing investors with a broad assessment of the 7 creditworthiness of a firm. Ratings generally extend from 8 9 triple-A (the highest) to D (in default). Other symbols 10 (e.g., "BBB+") are used to show relative standing within a 11 category. Because the rating agencies' evaluation 12 includes virtually all of the factors normally considered 13 important in assessing a firm's relative credit standing, 14 corporate credit ratings provide a broad, objective 15 measure of overall investment risk that is readily 16 available to investors. Although the credit rating 17 agencies are not immune to criticism, their rankings and analyses are widely cited in the investment community and 18 Investment restrictions tied to 19 referenced by investors. credit ratings continue to influence capital flows, and 20 21 credit ratings are also frequently used as a primary risk 22 indicator in establishing proxy groups to estimate the 23 cost of common equity.

> Exhibit No. 3 Case Nos. AVU-E-15-05/AVU-G-15-01 A. McKenzie, Avista Schedule 2, Page 3 of 47

1 While credit ratings provide the most widely 2 referenced benchmark for investment risks, other quality rankings published by investment advisory services also 3 provide relative assessments of risks that are considered 4 by investors in forming their expectations for common 5 6 stocks. Value Line's primary risk indicator is its Safety Rank, which ranges from "1" (Safest) to "5" (Riskiest). 7 This overall risk measure is intended to capture the total 8 risk of a stock, and incorporates elements of stock price 9 10 stability and financial strength. Given that Value Line 11 is perhaps the most widely available source of investment advisory information, its Safety Rank provides useful 12 13 guidance regarding the risk perceptions of investors.

14 The Financial Strength Rating is designed as a guide to overall financial strength and creditworthiness, with 15 the key inputs including financial leverage, business 16 17 volatility measures, and company size. Value Line's 18 Financial Strength Ratings range from "A++" (strongest) 19 down to "C" (weakest) in nine steps. Finally, Value 20 Line's beta measures a utility's stock price volatility relative to the market as a whole. A stock that tends to 21 22 respond less to market movements has a beta less than

> Exhibit No. 3 Case Nos. AVU-E-15-05/AVU-G-15-01 A. McKenzie, Avista Schedule 2, Page 4 of 47

1	1.00, while stocks that tend to move more than the market
2	have betas greater than 1.00. Beta is the only relevant
3	measure of investment risk under modern capital market
4	theory, and is widely cited in academics and in the
5	investment industry as a guide to investors' risk
6	perceptions. Moreover, in my experience Value Line is the
7	most widely referenced source for beta in regulatory
8	proceedings. As noted in New Regulatory Finance:
9 10 11 12 13 14 15 16 17	Value Line is the largest and most widely circulated independent investment advisory service, and influences the expectations of a large number of institutional and individual investors Value Line betas are computed on a theoretically sound basis using a broadly based market index, and they are adjusted for the regression tendency of betas to converge to 1.00. ¹
18	0. How do the overall risks of your proxy group

18 Q. How do the overall risks of your proxy group
19 compare with Avista?
20 A. Table 1 compares the Utility Group with Avista

21 across five key indicators of investment risk:

¹ Morin, Roger A., "New Regulatory Finance," *Public Utilities Reports* at 71 (2006).

TABLE 1			
COMPARISON	OF	RISK	INDICATORS

			Value Line		
Proxy Group	S&P	Moody's	Safety Rank	Financial Strength	Beta
Utility Group	BBB+	Baa1	2	B++	0.77
Avista	BBB	Baa1	2	А	0.80

3 Considered together, this comparison of objective 4 measures, which consider a broad spectrum of risks, 5 including financial and business position, and exposure to 6 firm-specific factors, indicates that investors would 7 likely conclude that the overall investment risks for 8 Avista are generally comparable to those of the firms in 9 the Utility Group.

B. Discounted Cash Flow Analyses

10	Q. How are DCF models used to estimate the cost of
11	equity?
12	A. DCF models attempt to replicate the market
13	valuation process that sets the price investors are
14	willing to pay for a share of a company's stock. The
15	model rests on the assumption that investors evaluate the
16	risks and expected rates of return from all securities in
17	the capital markets. Given these expectations, the price
18	of each stock is adjusted by the market until investors
19	are adequately compensated for the risks they bear.

Exhibit No. 3 Case Nos. AVU-E-15-05/AVU-G-15-01 A. McKenzie, Avista Schedule 2, Page 6 of 47

1 Therefore, we can look to the market to determine what 2 investors believe a share of common stock is worth. By estimating the cash flows investors expect to receive from 3 the stock in the way of future dividends and capital 4 gains, we can calculate their required rate of return. 5 6 That is, the cost of equity is the discount rate that equates the current price of a share of stock with the 7 8 present value of all expected cash flows from the stock. 9 The formula for the general form of the DCF model is as follows: 10

$$P_0 = \frac{D_1}{(1+k_e)^1} + \frac{D_2}{(1+k_e)^2} + \dots + \frac{D_t}{(1+k_e)^t} + \frac{P_t}{(1+k_e)^t}$$

11

12	where:	P_0 = Current price per share;
13		P_t = Expected future price per share in
14		period t;
15		D_t = Expected dividend per share in period t;
16		k_e = Cost of common equity.

1	Q. What form of the DCF model is customarily used
2	to estimate the cost of equity in rate cases?
3	A. Rather than developing annual estimates of cash
4	flows into perpetuity, the DCF model can be simplified to
5	a "constant growth" form: ²
6	$P_0 = \frac{D_1}{k_e - g}$
7 8 9 10 11 12	<pre>where: P₀ = Current price per share; D₁ = Expected dividend per share in the</pre>
13	The cost of equity (K_e) can be isolated by rearranging

14 terms:

$$k_e = \frac{D_1}{P_0} + g$$

15

16 This constant growth form of the DCF model recognizes that 17 the rate of return to stockholders consists of two parts: 18 1) dividend yield (D_1/P_0) , and 2) growth (g). In other 19 words, investors expect to receive a portion of their

² The constant growth DCF model is dependent on a number of assumptions, which in practice are never strictly met. These include a constant growth rate for both dividends and earnings; a stable dividend payout ratio; the discount rate exceeds the growth rate; a constant growth rate for book value and price; a constant earned rate of return on book value; no sales of stock at a price above or below book value; a constant price-earnings ratio; a constant discount rate (*i.e.*, no changes in risk or interest rate levels and a flat yield curve); and all of the above extend to infinity.

total return in the form of current dividends and the
 remainder through price appreciation.

What steps are required to apply the DCF model? 3 0. 4 The first step in implementing the constant Α. 5 growth DCF model is to determine the expected dividend yield (D_1/P_0) for the firm in question. This is usually 6 7 calculated based on an estimate of dividends to be paid in the coming year divided by the current price of the stock. 8 9 The second step is to estimate investors' long-term growth 10 expectations (q) for the firm. The final step is to sum 11 the firm's dividend yield and estimated growth rate to arrive at an estimate of its cost of equity. 12

13 Q. How was the dividend yield for the Utility Group 14 determined?

15 Estimates of dividends to be paid by each of Α. 16 these utilities over the next twelve months, obtained from Value Line, served as D_1 . This annual dividend was then 17 divided by a 30-day average stock price for each utility 18 19 to arrive at the expected dividend yield. The expected dividends, stock prices, and resulting dividend yields for 20 21 the firms in the Utility Group are presented on page 1 of 22 Schedule 5.

> Exhibit No. 3 Case Nos. AVU-E-15-05/AVU-G-15-01 A. McKenzie, Avista Schedule 2, Page 9 of 47

Q. What is the next step in applying the constant growth DCF model?

The next step is to evaluate long-term growth 3 Α. expectations, or "q", for the firm in question. 4 In 5 constant growth DCF theory, earnings, dividends, book value, and market price are all assumed to grow in 6 lockstep, and the growth horizon of the DCF model is 7 infinite. But implementation of the DCF model is more 8 9 than just a theoretical exercise; it is an attempt to replicate the mechanism investors used to arrive at 10 11 observable stock prices. A wide variety of techniques can 12 be used to derive growth rates, but the only "q" that 13 matters in applying the DCF model is the value that 14 investors expect.

Q. What are investors most likely to consider in
 developing their long-term growth expectations?

A. Given that the DCF model is solely concerned with replicating the forward-looking evaluation of realworld investors, in the case of utilities, dividend growth rates are not likely to provide a meaningful guide to investors' current growth expectations. This is because utilities have significantly altered their dividend policies in response to more accentuated business risks in

> Exhibit No. 3 Case Nos. AVU-E-15-05/AVU-G-15-01 A. McKenzie, Avista Schedule 2, Page 10 of 47

the industry, with payout ratios remaining significantly below historical levels. As a result of this trend towards a more conservative payout ratio, dividend growth in the utility industry has lagged growth in earnings as utilities conserve financial resources to provide a hedge against heightened uncertainties.

A measure that plays a pivotal role in determining 7 investors' long-term growth expectations are future trends 8 in earnings per share ("EPS"), which provide the source 9 10 for future dividends and ultimately support share prices. 11 The importance of earnings in evaluating investors' 12 expectations and requirements is well accepted in the 13 investment community, and surveys of analytical techniques 14 relied on by professional analysts indicate that growth in earnings is far more influential than trends in dividends 15 per share ("DPS"). 16

The availability of projected EPS growth rates also is key to investors relying on this measure as compared to future trends in DPS. Apart from Value Line, investment advisory services do not generally publish comprehensive DPS growth projections, and this scarcity of dividend growth rates relative to the abundance of earnings

> Exhibit No. 3 Case Nos. AVU-E-15-05/AVU-G-15-01 A. McKenzie, Avista Schedule 2, Page 11 of 47

forecasts attests to their relative influence. The fact that securities analysts focus on EPS growth, and that DPS growth rates are not routinely published, indicates that projected EPS growth rates are likely to provide a superior indicator of the future long-term growth expected by investors.

Q. Do the growth rate projections of security analysts consider historical trends?

9 A. Yes. Professional security analysts study 10 historical trends extensively in developing their 11 projections of future earnings. Hence, to the extent 12 there is any useful information in historical patterns, 13 that information is incorporated into analysts' growth 14 forecasts.

Q. Did Professor Myron J. Gordon, who originated
 the DCF approach, recognize the pivotal role that earnings
 play in forming investors' expectations?
 A. Yes. Dr. Gordon specifically recognized that

19 "it is the growth that investors expect that should be 20 used" in applying the DCF model and he concluded:

> Exhibit No. 3 Case Nos. AVU-E-15-05/AVU-G-15-01 A. McKenzie, Avista Schedule 2, Page 12 of 47

A number of considerations suggest that 1 investors may, in fact, use earnings growth as a 2 measure of expected future growth."³ 3 4 Are analysts' assessments of growth rates ο. 5 appropriate for estimating investors' required return 6 using the DCF model? 7 Α. In applying the DCF model to estimate the Yes.

cost of common equity, the only relevant growth rate is 8 9 the forward-looking expectations of investors that are 10 captured in current stock prices. Investors, just like 11 securities analysts and others in the investment 12 community, do not know how the future will actually turn 13 They can only make investment decisions based on out. 14 their best estimate of what the future holds in the way of 15 long-term growth for a particular stock, and securities prices are constantly adjusting to reflect their 16 assessment of available information. 17

Any claims that analysts' estimates are not relied upon by investors are illogical given the reality of a competitive market for investment advice. The market for investment advice is intensely competitive, and securities analysts are personally and professionally motivated to provide the most accurate assessment possible of future

³ Gordon, Myron J., "The Cost of Capital to a Public Utility," *MSU Public Utilities Studies* at 89 (1974).

growth trends. If financial analysts' forecasts do not 1 2 add value to investors' decision making, then it is 3 irrational for investors to pay for these estimates. Those financial analysts who fail to provide reliable 4 forecasts will lose out in competitive markets relative to 5 6 those analysts whose forecasts investors find more 7 credible. The reality that analyst estimates are routinely referenced in the financial media and in 8 investment advisory publications (e.g., Value Line) 9 10 implies that investors use them as a basis for their 11 expectations.

12 While the projections of securities analysts may be 13 proven optimistic or pessimistic in hindsight, this is 14 irrelevant in assessing the expected growth that investors 15 have incorporated into current stock prices, and any bias in analysts' forecasts - whether pessimistic or optimistic 16 17 - is irrelevant if investors share analysts' views. 18 Earnings growth projections of security analysts provide 19 the most frequently referenced guide to investors' views 20 and are widely accepted in applying the DCF model. As 21 explained in New Regulatory Finance: 22 Because of the dominance of institutional

23 investors and their influence on individual

Exhibit No. 3 Case Nos. AVU-E-15-05/AVU-G-15-01 A. McKenzie, Avista Schedule 2, Page 14 of 47

1 investors, analysts' forecasts of long-run 2 growth rates provide a sound basis for 3 estimating required returns. Financial analysts exert a strong influence on the expectations of 4 5 many investors who do not possess the resources 6 to make their own forecasts, that is, they are a 7 The accuracy of these cause of q [qrowth]. 8 forecasts in the sense of whether they turn out to be correct is not an issue here, as long as 9 they reflect widely held expectations.⁴ 10 What are security analysts currently projecting 11 0. 12 in the way of growth for the firms in the Utility Proxy 13 Group? 14 The projected EPS growth rates for each of the Α. 15 firms in the Utility Group reported by Value Line, IBES, 16 and Zacks Investment Research ("Zacks") are displayed on page 2 of Schedule 5.⁵ 17 18 0. How else are investors' expectations of future 19 long-term growth prospects often estimated for use in the constant growth DCF model? 20 21 Α. In constant growth theory, growth in book equity 22 will be equal to the product of the earnings retention 23 ratio (one minus the dividend payout ratio) and the earned 24 rate of return on book equity. Furthermore, if the earned 25 rate of return and the payout ratio are constant over 26 time, growth in earnings and dividends will be equal to

⁴ Morin, Roger A., "New Regulatory Finance," Public Utilities Reports, Inc. at 298 (2006) (emphasis added).
⁵ Formerly I/B/E/S International, Inc., IBES growth rates are now compiled and published by Thomson Reuters. 1 growth in book value. Despite the fact that these
2 conditions are seldom, if ever, met in practice, this
3 "sustainable growth" approach may provide a rough guide
4 for evaluating a firm's growth prospects and is frequently
5 proposed in regulatory proceedings.

6 The sustainable growth rate is calculated by the formula, q = br+sv, where "b" is the expected retention 7 ratio, "r" is the expected earned return on equity, "s" is 8 the percent of common equity expected to be issued 9 10 annually as new common stock, and "v" is the equity accretion rate. Under DCF theory, the "sv" factor is a 11 12 component of the growth rate designed to capture the 13 impact of issuing new common stock at a price above, or 14 below, book value. The sustainable, "br+sv" growth rates 15 for each firm in the Utility Group are summarized on page 2 of Schedule 5, with the underlying details being 16 presented on Schedule 6.6 17

18 Q. Are there significant shortcomings associated 19 with the "br+sv" growth rate?

A. Yes. First, in order to calculate thesustainable growth rate, it is necessary to develop

⁶ Because Value Line reports end-of-year book values, an adjustment factor was incorporated to compute an average rate of return over the year, which is consistent with the theory underlying this approach.

estimates of investors' expectations for four separate 1 2 variables; namely, "b", "r", "s", and "v." Given the 3 inherent difficulty in forecasting each parameter and the 4 difficulty of estimating the expectations of investors, 5 the potential for measurement error is significantly 6 increased when using four variables, as opposed to referencing a direct projection for EPS growth. Second, 7 empirical research in the finance literature indicates 8 that sustainable growth rates are not as significantly 9 10 correlated to measures of value, such as share prices, as are analysts' EPS growth forecasts.⁷ 11

12 The "sustainable growth" approach was included for 13 completeness, but evidence indicates that analysts' 14 forecasts provide a superior and more direct guide to 15 investors' growth expectations. Accordingly, I give less 16 weight to cost of equity estimates based on br+sv growth 17 rates in evaluating the results of the DCF model.

Q. What cost of equity estimates were implied for
 the Utility Group using the DCF model?

20 A. After combining the dividend yields and 21 respective growth projections for each utility, the

⁷ Morin, Roger A., "New Regulatory Finance," *Public Utilities Reports, Inc.*, at 307 (2006).

resulting cost of equity estimates are shown on page 3 of
 Schedule 5.

Q. In evaluating the results of the constant growth
DCF model, is it appropriate to eliminate illogical
estimates?

A. Yes. In applying quantitative methods to estimate the cost of equity, it is essential that the resulting values pass fundamental tests of reasonableness and economic logic. Accordingly, DCF estimates that are implausibly low or high should be eliminated when evaluating the results of this method.

12 Q. How did you evaluate DCF estimates at the low
13 end of the range?

14 Α. I based my evaluation of DCF estimates at the 15 low end of the range on the fundamental risk-return 16 tradeoff, which holds that investors will only take on more risk if they expect to earn a return to compensate 17 18 them for the greater uncertainty. Because common stocks 19 lack the protections associated with an investment in 20 long-term bonds, a utility's common stock imposes far greater risks on investors. As a result, the rate of 21 22 return that investors require from a utility's common 23 stock is considerably higher than the yield offered by

> Exhibit No. 3 Case Nos. AVU-E-15-05/AVU-G-15-01 A. McKenzie, Avista Schedule 2, Page 18 of 47

senior, long-term debt. Consistent with this principle,
 DCF results that are not sufficiently higher than the
 yields available on less risky utility bonds must be
 eliminated.

5 Have similar tests been applied by regulators? Q. 6 Α. Yes. FERC has noted that adjustments are 7 justified where applications of the DCF approach produce 8 illogical results. FERC evaluates DCF results against 9 observable yields on long-term public utility debt and has 10 recognized that it is appropriate to eliminate estimates that do not sufficiently exceed this threshold.⁸ FERC 11 12 recently affirmed that:

13 The purpose of the low-end outlier test is to 14 exclude from the proxy group those companies 15 whose ROE estimates are below the average bond 16 yield or are above the average bond yield but 17 are sufficiently low that an investor would 18 consider the stock to yield essentially the same 19 return as debt. In public utility ROE cases, 20 the Commission has used 100 basis points above 21 the cost of debt as an approximation of this 22 threshold, but has also considered the distribution of proxy group companies to inform 23 its decision on which companies are outliers. 24 As the Presiding Judge explained, this is a 25 flexible test.⁹ 26

⁸ See, e.g., Southern California Edison Co., 131 FERC ¶ 61,020 at P 55 (2010) ("SoCal Edison").

 9 Martha Coakley et al., v. Bangor Hydro-Electric Company, et al., Opinion No. 531, 147 FERC \P 61,234 at P 122 (2014).

1	Q. What interest rate benchmark did you consider in
2	evaluating the DCF results for Avista?
3	A. As noted earlier, the S&P and Moody's ratings
4	for Avista are BBB and Baal, respectively, which fall in
5	the triple-B rating category. Accordingly, I referenced
б	average yields on triple-B utility bonds as my benchmark
7	in evaluating low-end results. Monthly yields on triple-B
8	bonds reported by Moody's averaged approximately 4.6
9	percent over the six months ending April 2015. 10
10	Q. What else should be considered in evaluating DCF
11	estimates at the low end of the range?
12	A. As indicated earlier, while long-term bond
13	yields have declined substantially in response to the
14	Federal Reserve's stimulus policies, it is generally
15	expected that long-term interest rates will rise as the
16	economy returns to a more normal pattern of growth and the
17	Federal Reserve normalizes monetary policies. As shown in
18	Table 2 below, forecasts of IHS Global Insight and the EIA
19	imply an average triple-B bond yield of approximately 6.8
20	percent over the period 2015-2019:

¹⁰ Moody's Investors Service,

http://credittrends.moodys.com/chartroom.asp?c=3.

TABLE 2 IMPLIED BBB BOND YIELD

	2015-19
Projected AA Utility Yield	
IHS Global Insight (a)	6.10%
EIA (b)	5.80%
Average	5.95%
Current BBB - AA Yield Spread (c)	0.82%
Implied Triple-B Utility Yield	6.77%

- (a) IHS Global Insight, The U.S. Economy: The 30-Year Focus (Third-Quarter 2014).
- (b) Energy Information Administration, Annual Energy Outlook 2015 (April 2015).
- (c) Based on monthly average bond yields from Moody's Investors Service for the six-month period Nov. 2014 - Apr. 2015.

The increase in debt yields anticipated by IHS Global 3 4 Insight and EIA is also supported by the widely-referenced 5 Blue Chip Financial Forecasts, which projects that yields 6 on corporate bonds will climb over 200 basis points through 2019.¹¹ 7 What does this test of logic imply with respect 8 ο. to the DCF estimates for the Utility Group? 9 10 Adding FERC's 100 basis-point premium to the Α. historical and projected average utility bond yields 11 12 implies a low-end threshold on the order of 5.6 percent to

¹¹ Blue Chip Financial Forecasts, Vol. 33, No. 12 (Dec. 1, 2014).

1 7.8 percent. As highlighted on page 3 of Schedule 5, 2 after considering this test and the distribution of individual estimates, I eliminated low-end DCF estimates 3 4 ranging from 3.5% to 6.8%. Based on my professional 5 experience and the risk-return tradeoff principle that is 6 fundamental to finance, it is inconceivable that investors 7 are not requiring a substantially higher rate of return for holding common stock. As a result, consistent with 8 the threshold established by historical and projected 9 10 utility bond yields, these values provide little guidance 11 as to the returns investors require from utility common stocks and should be excluded. 12

Q. Is there a basis to eliminate high-end values
from the range of DCF results produced for the Utility
Group?

16 While it is just as important to evaluate DCF Α. 17 estimates at the upper end of the range, there is no 18 objective benchmark analogous to the bond yield averages 19 used to eliminate illogical low-end values. In response, 20 FERC has consistently applied a two-pronged test for highend values based on the magnitude of the cost of equity 21 22 estimate and its underlying growth rate. As FERC 23 observed:

> Exhibit No. 3 Case Nos. AVU-E-15-05/AVU-G-15-01 A. McKenzie, Avista Schedule 2, Page 22 of 47

The Presiding Judge found that the [utilities'] 1 2 criteria for screening high-end outliers 3 substantially complies with Commission precedent. . . . The Presiding Judge further 4 5 stated that the Commission's high-end outlier test since 2004 has been to exclude from the 6 7 proxy group any company whose cost of equity estimate is at or above 17.7 percent and whose 8 growth rate is at or above 13.3 percent.¹² 9

10 The upper end of the DCF range for the Utility Group 11 was set by a cost of equity estimate of 13.9 percent. 12 This cost of equity estimate, and the underlying growth 13 rate of 10.0 percent, falls well below the threshold tests employed by FERC. Moreover, while this cost of equity 14 15 estimate may exceed the majority of the remaining values, 16 remaining low-end estimates in the 7.0 percent range are 17 assuredly far below investors' required rate of return. 18 Taken together and considered along with the balance of 19 the DCF estimates, these values provide a reasonable basis 20 on which to frame the range of plausible DCF estimates and evaluate investors' required rate of return. 21

Q. What cost of equity is implied by your DCF
 results for the Utility Group?

A. As shown on page 3 of Schedule 5 and summarized in Table 3, below, after eliminating illogical low-end

¹² Opinion No. 531 at P 115 (footnotes omitted).

- 1 values, application of the constant growth DCF model
- 2 resulted in the following cost of equity estimates:

C. Empirical Capital Asset Pricing Model

5 Please describe the ECAPM. ο. The ECAPM is a variant of the traditional CAPM, 6 Α. which is a theory of market equilibrium that measures risk 7 using the beta coefficient. Assuming investors are fully 8 diversified, the relevant risk of an individual asset 9 10 (e.g., common stock) is its volatility relative to the market as a whole, with beta reflecting the tendency of a 11 stock's price to follow changes in the market. A stock 12 13 that tends to respond less to market movements has a beta less than 1.00, while stocks that tend to move more than 14 the market have betas greater than 1.00. The CAPM is 15 16 mathematically expressed as:

> Exhibit No. 3 Case Nos. AVU-E-15-05/AVU-G-15-01 A. McKenzie, Avista Schedule 2, Page 24 of 47

Schedule 2 Page 25 of 47

for stock j;

1	R _j =	$R_f + \beta_j (R_m - R_f)$
2	where: R_j =	required rate of return for st
3	R _f =	risk-free rate;
4	$R_m =$	expected return on the market
_		

5 portfolio; and, 6 β_j = beta, or systematic risk, for 7 stock j.

Like the DCF model, the ECAPM is an *ex-ante*, or forwardlooking model based on expectations of the future. As a result, in order to produce a meaningful estimate of investors' required rate of return, the ECAPM must be applied using estimates that reflect the expectations of actual investors in the market, not with backward-looking, historical data.

Why is the ECAPM approach an appropriate 15 ο. 16 component of evaluating the cost of equity for Avista? 17 The CAPM approach, which forms the foundation of Α. 18 the ECAPM, generally is considered to be the most widely 19 referenced method for estimating the cost of equity among 20 academicians and professional practitioners, with the pioneering researchers of this method receiving the Nobel 21 22 Prize in 1990. Because this is the dominant model for 23 estimating the cost of equity outside the regulatory 24 sphere, the ECAPM provides important insight into

> Exhibit No. 3 Case Nos. AVU-E-15-05/AVU-G-15-01 A. McKenzie, Avista Schedule 2, Page 25 of 47

1 investors' required rate of return for utility stocks, 2 including Avista.

How does the ECAPM approach differ from 3 0. traditional applications of the CAPM? 4

5 Empirical tests of the CAPM have shown that low-Α. 6 beta securities earn returns somewhat higher than the CAPM 7 would predict, and high-beta securities earn less than 8 predicted. In other words, the CAPM tends to overstate 9 the actual sensitivity of the cost of capital to beta, 10 with low-beta stocks tending to have higher returns and 11 high-beta stocks tending to have lower risk returns than 12 predicted by the CAPM. This empirical finding is widely 13 reported in the finance literature, as summarized in New

14 Regulatory Finance:

15 As discussed in the previous section, several finance scholars have developed refined and 16 17 expanded versions of the standard CAPM by 18 relaxing the constraints imposed on the CAPM, 19 such as dividend yield, size, and skewness 20 These enhanced CAPMs typically produce effects. 21 a risk-return relationship that is flatter than 22 the CAPM prediction in keeping with the actual observed risk-return relationship. The ECAPM 23 makes use of these empirical relationships.¹³ 24

25 As discussed in New Regulatory Finance, based on a review

- 26
- of the empirical evidence, the expected return on a

¹³ Morin, Roger A., "New Regulatory Finance," Public Utilities Reports at 189 (2006).

security is related to its risk by the ECAPM, which is represented by the following formula:

 $R_{j} = R_{f} + 0.25(R_{m} - R_{f}) + 0.75[\beta_{j}(R_{m} - R_{f})]$ 3 This ECAPM equation, and the associated weighting factors, 4 5 recognize the observed relationship between standard CAPM 6 estimates and the cost of capital documented in the 7 financial research, and correct for the understated 8 returns that would otherwise be produced for low beta 9 stocks. 10 How did you apply the ECAPM to estimate the cost ο. 11 of common equity? 12 Application of the ECAPM to the Utility Group Α. 13 based on a forward-looking estimate for investors' required rate of return from common stocks is presented on 14 Schedule 7. In order to capture the expectations of 15 16 today's investors in current capital markets, the expected 17 market rate of return was estimated by conducting a DCF 18 analysis on the dividend paying firms in the S&P 500. 19 The dividend yield for each firm was obtained from 20 Value Line, and the growth rate was equal to the average of the earnings growth projections for each firm published 21 by IBES and Value Line, with each firm's dividend yield 22

> Exhibit No. 3 Case Nos. AVU-E-15-05/AVU-G-15-01 A. McKenzie, Avista Schedule 2, Page 27 of 47

1	and growth rate being weighted by its proportionate share
2	of total market value. Based on the weighted average of
3	the projections for the individual firms, current
4	estimates imply an average growth rate over the next five
5	years of 9.2 percent. Combining this average growth rate
6	with a year-ahead dividend yield of 2.3 percent results in
7	a current cost of common equity estimate for the market as
8	a whole $(\mathtt{R}_{\mathtt{m}})$ of approximately 11.5 percent. Subtracting a
9	2.7 percent risk-free rate based on the average yield on
10	30-year Treasury bonds for the six months ending April
11	2015 produced a market equity risk premium of 8.8 percent.
11 12	2015 produced a market equity risk premium of 8.8 percent. Q. What was the source of the beta values you used
12	Q. What was the source of the beta values you used
12 13	Q. What was the source of the beta values you used to apply the CAPM?
12 13 14	Q. What was the source of the beta values you used to apply the CAPM? A. I relied on the beta values reported by Value
12 13 14 15	Q. What was the source of the beta values you used to apply the CAPM? A. I relied on the beta values reported by Value Line, which in my experience is the most widely referenced

2 1.00.¹⁴

Q. What else should be considered in applying the
ECAPM?

5

A. As explained by Morningstar:

6 One of the most remarkable discoveries of modern 7 finance is that of a relationship between firm 8 size and return. The relationship cuts across 9 the entire size spectrum but is most evident 10 among smaller companies, which have higher 11 returns on average than larger ones.¹⁵

Because empirical research indicates that the ECAPM does not fully account for observed differences in rates of return attributable to firm size, a modification is required to account for this size effect.

16 According to the ECAPM, the expected return on a security should consist of the riskless rate, plus a 17 18 premium to compensate for the systematic risk of the 19 particular security. The degree of systematic risk is 20 represented by the beta coefficient. The need for the 21 size adjustment arises because differences in investors' 22 required rates of return that are related to firm size are 23 not fully captured by beta. To account for this, 24 Morningstar has developed size premiums that need to be

¹⁴ Morin, Roger A., "New Regulatory Finance," Public Utilities Reports at 71 (2006).
¹⁵ Morningstar, "Ibbotson SBBI 2013 Valuation Yearbook," at p. 85 (footnote omitted).

1 added to the theoretical ECAPM cost of equity estimates to account for the level of a firm's market capitalization in 2 determining the ECAPM cost of equity. These premiums 3 4 correspond to the size deciles of publicly traded common stocks, and range from a premium of 5.7 percent for a 5 6 company in the first decile (market capitalization less than \$300.85 million), to a reduction of 32 basis points 7 for firms in the tenth decile (market capitalization 8 greater than \$24.4 billion).¹⁶ Accordingly, my ECAPM 9 10 analyses incorporated an adjustment to recognize the impact of size distinctions, as measured by the average 11 12 market capitalization for the Utility Group.

Q. What cost of equity is indicated for the Utility
Group using the ECAPM approach?

A. As shown on page 1 of Schedule 7, a forwardlooking application of the ECAPM approach resulted in an average unadjusted ROE estimate of 10.0 percent.¹⁷ After adjusting for the impact of firm size, the ECAPM approach implied an average cost of equity of 11.1 percent for the Utility Group, with a midpoint cost of equity estimate of 10.9 percent.

¹⁶ Morningstar, "2015 Ibbotson SBBI Market Report," at Table 10 (2015).
 ¹⁷ The midpoint of the unadjusted ECAPM range was 10.2%.

Did you also apply the ECAPM using forecasted 1 0. 2 bond yields? As discussed earlier, there is widespread 3 Α. Yes. consensus that interest rates will increase materially as 4 5 the economy continues to strengthen. Accordingly, in addition to the use of current bond yields, I also applied 6 7 the ECAPM based on the forecasted long-term Treasury bond yields developed based on projections published by Value 8 9 Line, IHS Global Insight and Blue Chip. As shown on page 10 2 of Schedule 7, incorporating a forecasted Treasury bond 11 yield for 2015-2019 implied a cost of equity of 12 approximately 10.3% for the Utility Group, or 11.4% after 13 adjusting for the impact of relative size. The midpoints 14 of the unadjusted and size adjusted cost of equity ranges were 10.4% and 11.1%, respectively. 15

D. <u>Risk Premium</u> Approach

16 Please briefly describe the risk premium method. Q. 17 The risk premium method of estimating investors' Α. 18 required rate of return extends to common stocks the risk-19 return tradeoff observed with bonds. The cost of equity 20 is estimated by first determining the additional return 21 investors require to forgo the relative safety of bonds 22 and to bear the greater risks associated with common

> Exhibit No. 3 Case Nos. AVU-E-15-05/AVU-G-15-01 A. McKenzie, Avista Schedule 2, Page 31 of 47

stock, and by then adding this equity risk premium to the current yield on bonds. Like the DCF model, the risk premium method is capital market oriented. However, unlike DCF models, which indirectly impute the cost of equity, risk premium methods directly estimate investors' required rate of return by adding an equity risk premium to observable bond yields.

8 Q. Is the risk premium approach a widely accepted 9 method for estimating the cost of equity?

10 Α. Yes. The risk premium approach is based on the 11 fundamental risk-return principle that is central to 12 finance, which holds that investors will require a premium 13 in the form of a higher return in order to assume 14 additional risk. This method is routinely referenced by the investment community and in academia and regulatory 15 16 proceedings, and provides an important tool in estimating a fair ROE for Avista. 17

Q. How did you implement the risk premium method?
A. I based my estimates of equity risk premiums for
electric utilities on surveys of previously authorized
ROEs. Authorized ROEs presumably reflect regulatory
commissions' best estimates of the cost of equity, however
determined, at the time they issued their final order.

Exhibit No. 3 Case Nos. AVU-E-15-05/AVU-G-15-01 A. McKenzie, Avista Schedule 2, Page 32 of 47 Moreover, allowed ROEs are an important consideration for
 investors and have the potential to influence other
 observable investment parameters, including credit ratings
 and borrowing costs. Thus, this data provides a logical
 and frequently referenced basis for estimating equity risk
 premiums for regulated utilities.

Is it circular to consider risk premiums based 7 ο. on authorized returns in assessing a fair ROE for Avista? 8 In establishing authorized ROEs, regulators 9 Α. No. 10 typically consider the results of alternative market-based 11 approaches, including the DCF model. Because allowed risk 12 premiums consider objective market data (e.g., stock 13 prices, dividends, beta, and interest rates), and are not 14 based strictly on past actions of other regulators, this 15 mitigates concerns over any potential for circularity.

16 How did you implement the risk premium approach 0. using surveys of allowed rates of return? 17 18 Α. The ROEs authorized for electric utilities by 19 regulatory commissions across the U.S. are compiled by 20 Regulatory Research Associates and published in its 21 Regulatory Focus report. On page 3 of Schedule 8, the 22 average yield on public utility bonds is subtracted from 23 the average allowed rate of return on common equity for

> Exhibit No. 3 Case Nos. AVU-E-15-05/AVU-G-15-01 A. McKenzie, Avista Schedule 2, Page 33 of 47

electric utilities to calculate equity risk premiums for
 each year between 1974 and 2014. Over this 40-year
 period, these equity risk premiums for electric utilities
 averaged 3.57 percent, and the yield on public utility
 bonds averaged 8.58 percent.

6 Q. Is there any capital market relationship that 7 must be considered when implementing the risk premium 8 method?

There is considerable evidence that the 9 Α. Yes. 10 magnitude of equity risk premiums is not constant and that 11 equity risk premiums tend to move inversely with interest In other words, when interest rate levels are 12 rates. 13 relatively high, equity risk premiums narrow, and when interest rates are relatively low, equity risk premiums 14 15 widen. The implication of this inverse relationship is 16 that the cost of equity does not move as much as, or in 17 lockstep with, interest rates. Accordingly, for a 1 18 percent increase or decrease in interest rates, the cost of equity may only rise or fall, say, 50 basis points. 19 20 Therefore, when implementing the risk premium method, adjustments may be required to incorporate this inverse 21 22 relationship if current interest rate levels diverge from

> Exhibit No. 3 Case Nos. AVU-E-15-05/AVU-G-15-01 A. McKenzie, Avista Schedule 2, Page 34 of 47

1 the average interest rate level represented in the data 2 set.

3 0. Has this inverse relationship been documented in the financial research? 4 5 This inverse relationship between equity Δ Yes. б risk premiums and interest rates has been widely reported 7 in the financial literature.¹⁸ For example, New Regulatory 8 Finance documented this inverse relationship: 9 Published studies by Brigham, Shome, and Vinson (1985), Harris (1986), Harris and Marston (1992, 10 11 1993), Carelton, Chambers, and Lakonishok (1983), Morin (2005), and McShane (2005), and 12 13 others demonstrate that, beginning in 1980, risk 14 premiums varied inversely with the level of 15 interest rates - rising when rates fell and 16 declining when rates rose.¹⁹ 17 Other regulators have also recognized that the cost of 18 equity does not move in tandem with interest rates.²⁰ 19 What are the implications of this relationship Q. under current capital market conditions? 20

¹⁸ See, e.g., Brigham, E.F., Shome, D.K., and Vinson, S.R., "The Risk Premium Approach to Measuring a Utility's Cost of Equity," *Financial Management* (Spring 1985); Harris, R.S., and Marston, F.C., "Estimating Shareholder Risk Premia Using Analysts' Growth Forecasts," *Financial Management* (Summer 1992).

¹⁹ Morin, Roger A., "New Regulatory Finance," Public Utilities Reports, at 128 (2006).

²⁰ See, e.g., California Public Utilities Commission, Decision 08-05-035 (May 29, 2008); Entergy Mississippi Formula Rate Plan FRP-5, http://www.entergy-mississippi.com/content/price/tariffs/emi_frp.pdf; Martha Coakley et al., 147 FERC ¶ 61,234 at P 147 (2014).

As noted earlier, bond yields are at 1 Α. 2 unprecedented lows. Given that equity risk premiums move inversely with interest rates, these uncharacteristically 3 low bond yields also imply a sharp increase in the equity 4 risk premium that investors require to accept the higher 5 6 uncertainties associated with an investment in utility 7 common stocks versus bonds. In other words, higher required equity risk premiums offset the impact of 8 declining interest rates on the ROE. 9

10 What cost of equity is implied by the risk ο. premium method using surveys of allowed ROEs? 11 12 Because risk premiums move inversely with Α. 13 interest rates and current bond yields are significantly 14 lower than the average over the study period, it is 15 necessary to adjust the average equity risk premium over 16 the study period to reflect the impact of changes in bond 17 yields. Based on the regression output between the 18 interest rates and equity risk premiums displayed on page 4 of Schedule 8, the equity risk premium for electric 19 utilities increased approximately 43 basis points for each 20 21 percentage point drop in the yield on average public 22 utility bonds. As illustrated on page 1 of Schedule 8, 23 with the yield on average public utility bonds for the six

> Exhibit No. 3 Case Nos. AVU-E-15-05/AVU-G-15-01 A. McKenzie, Avista Schedule 2, Page 36 of 47

months ending April 2015 being 4.03 percent, this implied a current equity risk premium of 5.51 percent for electric utilities. Adding this equity risk premium to the yield on triple-B utility bonds of 4.55 percent produces a current cost of equity of approximately 10.1 percent.

6 Q. What cost of equity was produced by the risk 7 premium approach after incorporating forecasted bond 8 yields?

9 Α. As shown on page 2 of Schedule 8, incorporating 10 a forecasted yield for 2015-2019 and adjusting for changes in interest rates since the study period implied an equity 11 risk premium of 4.56 percent for electric utilities. 12 13 Adding this equity risk premium to the average implied yield on triple-B public utility bonds for 2015-2019 of 14 15 6.77 percent resulted in an implied cost of equity of 16 approximately 11.3 percent.

II. OTHER ROE BENCHMARKS

Q. What is the purpose of this section?
A. This section presents alternative tests to
demonstrate that the end-results of the ROE analyses
discussed earlier are reasonable and do not exceed a fair
ROE. The first test is based on applications of the
traditional CAPM analysis using current and projected

Exhibit No. 3 Case Nos. AVU-E-15-05/AVU-G-15-01 A. McKenzie, Avista Schedule 2, Page 37 of 47 interest rates. The second test is based on expected
 earned returns for electric utilities. Finally, I present
 a DCF analysis for a low risk group of non-utility firms,
 with which Avista must compete for investors' money.

A. Capital Asset Pricing Model

5 Q. What cost of equity estimates were indicated by 6 the traditional CAPM?

My applications of the traditional CAPM were 7 Α. based on the same forward-looking market rate of return, 8 9 risk-free rates, and beta values discussed earlier in connections with the ECAPM. As shown on page 1 of 10 11 Schedule 9, applying the forward-looking CAPM approach to 12 the firms in the Utility Group results in an average 13 theoretical cost of equity estimate of 9.5 percent, or 14 10.6 percent after incorporating the size adjustment 15 corresponding to the market capitalization of the individual utilities. 16

As shown on page 2 of Schedule 9, incorporating a forecasted Treasury bond yield for 2015-2019 implied a cost of equity of approximately 9.9 percent for the Utility Group, or 11.0 percent after adjusting for the impact of relative size.

> Exhibit No. 3 Case Nos. AVU-E-15-05/AVU-G-15-01 A. McKenzie, Avista Schedule 2, Page 38 of 47

B. Expected Earnings Approach

Q. What other analyses did you conduct to estimate
 the cost of common equity?

A. As noted earlier, I also evaluated the cost ofcommon equity using the expected earnings method.

Reference to rates of return available from alternative 5 investments of comparable risk can provide an important 6 7 benchmark in assessing the return necessary to assure confidence in the financial integrity of a firm and its 8 ability to attract capital. This expected earnings 9 approach is consistent with the economic underpinnings for 10 11 a fair rate of return established by the U.S. Supreme 12 Court in *Bluefield* and *Hope*. Moreover, it avoids the 13 complexities and limitations of capital market methods and instead focuses on the returns earned on book equity, 14 15 which are readily available to investors.

Q. What economic premise underlies the expected
earnings approach?

A. The simple, but powerful concept underlying the expected earnings approach is that investors compare each investment alternative with the next best opportunity. If the utility is unable to offer a return similar to that available from other opportunities of comparable risk,

> Exhibit No. 3 Case Nos. AVU-E-15-05/AVU-G-15-01 A. McKenzie, Avista Schedule 2, Page 39 of 47

1 investors will become unwilling to supply the capital on 2 reasonable terms. For existing investors, denying the 3 utility an opportunity to earn what is available from 4 other similar risk alternatives prevents them from earning their opportunity cost of capital. In this situation the 5 6 government is effectively taking the value of investors' capital without adequate compensation. 7 The expected earnings approach is consistent with the economic 8 rationale underpinning established regulatory standards, 9 10 which specifies a methodology to determine an ROE benchmark based on earned rates of return for a peer group 11 of other utilities. 12

13 Q. How is the expected earnings approach typically 14 implemented?

The traditional comparable earnings test 15 Α. 16 identifies a group of companies that are believed to be 17 comparable in risk to the utility. The actual earnings of 18 those companies on the book value of their investment are then compared to the allowed return of the utility. While 19 20 the traditional comparable earnings test is implemented 21 using historical data taken from the accounting records, 22 it is also common to use projections of returns on book 23 investment, such as those published by recognized

> Exhibit No. 3 Case Nos. AVU-E-15-05/AVU-G-15-01 A. McKenzie, Avista Schedule 2, Page 40 of 47

investment advisory publications (e.g., Value Line).
 Because these returns on book value equity are analogous
 to the allowed return on a utility's rate base, this
 measure of opportunity costs results in a direct, "apples
 to apples" comparison.

6 Moreover, regulators do not set the returns that investors earn in the capital markets, which are a 7 function of dividend payments and fluctuations in common 8 stock prices- both of which are outside their control. 9 10 Regulators can only establish the allowed ROE, which is applied to the book value of a utility's investment in 11 rate base, as determined from its accounting records. 12 13 This is directly analogous to the expected earnings 14 approach, which measures the return that investors expect the utility to earn on book value. As a result, the 15 expected earnings approach provides a meaningful guide to 16 17 ensure that the allowed ROE is similar to what other 18 utilities of comparable risk will earn on invested 19 capital. This expected earnings test does not require 20 theoretical models to indirectly infer investors' perceptions from stock prices or other market data. 21 As 22 long as the proxy companies are similar in risk, their

> Exhibit No. 3 Case Nos. AVU-E-15-05/AVU-G-15-01 A. McKenzie, Avista Schedule 2, Page 41 of 47

expected earned returns on invested capital provide a
 direct benchmark for investors' opportunity costs that is
 independent of fluctuating stock prices, market-to-book
 ratios, debates over DCF growth rates, or the limitations
 inherent in any theoretical model of investor behavior.

6 What rates of return on equity are indicated for ο. 7 utilities based on the expected earnings approach? Value Line's projections imply an average rate 8 Α. 9 of return on common equity for the electric utility 10 industry of 10.6 percent over its 2017-2019 forecast horizon.²¹ Meanwhile, for the firms in the Utility Group 11 12 specifically, the year-end returns on common equity 13 projected by Value Line over its forecast horizon are 14 shown on Schedule 10. Consistent with the rationale 15 underlying the development of the br+sv growth rates, 16 these year-end values were converted to average returns 17 using the same adjustment factor discussed earlier and 18 developed on Schedule 6. As shown on Schedule 10, Value Line's projections for the Utility Group suggest an 19 average ROE of approximately 10.3 percent, with a midpoint 20 21 value of 10.8 percent.

²¹ The Value Line Investment Survey (Feb. 20, Mar. 20, & May 1, 2015). Recall that Value Line reports return on year-end equity so the equivalent return on average equity would be higher.

C. Low Risk Non-Utility DCF

Q. What other proxy group did you consider in
 evaluating a fair ROE for Avista?

A. Consistent with underlying economic and regulatory standards, I also applied the DCF model to a reference group of low-risk companies in the non-utility sectors of the economy. I refer to this group as the "Non-Utility Group".

8 Q. Do utilities have to compete with non-regulated 9 firms for capital?

The cost of capital is an opportunity cost 10 Α. Yes. based on the returns that investors could realize by 11 12 putting their money in other alternatives. Clearly, the total capital invested in utility stocks is only the tip 13 of the iceberg of total common stock investment, and there 14 are a plethora of other enterprises available to investors 15 16 beyond those in the utility industry. Utilities must compete for capital, not just against firms in their own 17 industry, but with other investment opportunities of 18 19 comparable risk. Indeed, modern portfolio theory is built 20 on the assumption that rational investors will hold a diverse portfolio of stocks, not just companies in a 21 22 single industry.

> Exhibit No. 3 Case Nos. AVU-E-15-05/AVU-G-15-01 A. McKenzie, Avista Schedule 2, Page 43 of 47

Q. Does consideration of the results for the Non Utility Group make the estimation of the cost of equity
 using the DCF model more reliable?

4 Α. Yes. The estimates of growth from the DCF model 5 depend on analysts' forecasts. It is possible for utility 6 growth rates to be distorted by short-term trends in the 7 industry, or by the industry falling into favor or disfavor by analysts. The result of such distortions 8 would be to bias the DCF estimates for utilities. 9 Because 10 the Non-Utility Group includes low risk companies from many industries, it diversifies away any distortion that 11 12 may be caused by the ebb and flow of enthusiasm for a 13 particular sector.

14 What criteria did you apply to develop the Nonο. Utility Group? 15 16 Α. The comparable risk proxy group was composed of 17 those U.S. companies followed by Value Line that: 18 1) pay common dividends; 19 2) have a Safety Rank of "1"; 20 3) have a Financial Strength Rating of "B++" or 21 qreater; 4) have a beta of 0.70 or less; and 2.2 23 5) have investment grade credit ratings from 24 S&P.

1	Q. How do the overall risks of this Non-Utility
2	Group compare with the Utility Group and Avista?
3	A. As illustrated in Table 5 to my testimony, the
4	average credit ratings, Safety Rank, Financial Strength
5	Rating, and beta for the Non-Utility Group suggest less
б	risk than for Avista and the proxy group of utilities.
7	When considered together, a comparison of these objective
8	measures, which consider a broad spectrum of risks,
9	including financial and business position, relative size,
10	and exposure to company-specific factors, indicates that
11	investors would likely conclude that the overall
12	investment risks for the Utility Group and Avista are
13	greater than those of the firms in the Non-Utility Group.
14	The thirteen companies that make up the Non-Utility
15	Group are representative of the pinnacle of corporate
16	America. These firms, which include household names such
17	as Colgate-Palmolive, McDonalds, and Wal-Mart, have long
18	corporate histories, well-established track records, and
19	exceedingly conservative risk profiles. Many of these
20	companies pay dividends on a par with utilities, with the
21	average dividend yield for the group approaching
22	3 percent. Moreover, because of their significance and
23	name recognition, these companies receive intense scrutiny

Exhibit No. 3 Case Nos. AVU-E-15-05/AVU-G-15-01 A. McKenzie, Avista Schedule 2, Page 45 of 47 by the investment community, which increases confidence
 that published growth estimates are representative of the
 consensus expectations reflected in common stock prices.

4 Q. What were the results of your DCF analysis for 5 the Non-Utility Group?

A. I applied the DCF model to the Non-Utility Group using the same analysts EPS growth projections described earlier for the Utility Group, with the results being presented in Schedule 11. As summarized in Table 4, below, application of the constant growth DCF model resulted in the following cost of equity estimates:

TABLE 4 DCF RESULTS - NON-UTILITY GROUP

	<u>Cost c</u>	<u>of Equity</u>
Growth Rate	<u>Average</u>	<u>Midpoint</u>
Value Line	10.1%	10.3%
IBES	9.4%	9.2%
Zacks	9.8%	10.1%

12	As discussed earlier, reference to the Non-Utility Group
13	is consistent with established regulatory principles.
14	Required returns for utilities should be in line with
15	those of non-utility firms of comparable risk operating
16	under the constraints of free competition. Considering
17	the lower risk associated with the Non-Utility Group,

Exhibit No. 3 Case Nos. AVU-E-15-05/AVU-G-15-01 A. McKenzie, Avista Schedule 2, Page 46 of 47 these DCF results suggests that the 9.9 percent requested ROE for Avista's utility operations is a conservative estimate of a fair return.

Q. Please summarize the results of your alternative ROE benchmarks.

A. The cost of common equity estimates produced by the various tests of reasonableness discussed above are shown on page 2 of Schedule 3, and summarized in Table 5, below:

(a) The Value Line Investment Survey (Feb. 20, Mar. 20, & May 1, 2015).

(b) Computed using the formula 2*(1+5-Yr. Change in Equity)/(2+5 Yr. Change in Equity).

(c) Product of average year-end "r" for 2019 and Adjustment Factor.

(d) Product of change in common shares outstanding and M/B Ratio.

(e) Computed as 1 - B/M Ratio.

(f) Product of total capital and equity ratio.

(g) Five-year rate of change.

(h) Average of High and Low expected market prices divided by 2019 BVPS.

EMPIRICAL CAPM - CURRENT BOND YIELD

	Average	10.1%	9.4%	9.8%	
	Midpoint (c)	10.3%	9.2%	10.1%	

(a)

Sum of dividend yield (Schedule 11, p. 1) and respective growth rate (Schedule 11, p. 2).

(b) Average of low and high values.

UTILITY GROUP

_

	Company	Mechanism
1	ALLETE	FCA, PGA, FTY, ICR, Investment Pre-approval, DSM, ECA, TCR
2	Ameren Corp.	FCA, PGA, ICR, DSM, ECA, BDR, PCR, Vegetation Mgt, SCR, FRP
3	American Elec Pwr	FCA, FTY, ICR, ECA, AMS, TCR, Vegetation Mgt, SCR, RDM
4	Avista Corp.	FCA, PGA, RDM
5	Black Hills Corp.	FCA, PGA, ICR, ECA, TCR, WNA, DSM, BDR, TAX
6	CenterPoint Energy	PGA, ICR, RDM, WNA, FRP, TCR, DSM, Nuclear Decommissioning, AMS, SCR
7	CMS Energy Corp.	FCA, PGA, RDM, FTY
o	DTE Eporeu Co	FCA, PGA, RDM, FTY, ICR, DSM, BDR, SCR, ECA, PCR, Line Clearance,
8	DTE Energy Co.	BDR, Nuclear Decommissioning
9	Edison International	FCA, RDM, FTY, PCR, ICR, Nuclear Decommissioning, DSM, ECA, TCR
10	El Paso Electric	FCA, FTY, DSM
11	Empire District Elec	FCA, PGA, DSM, TCR, PCR, Hybrid Test Year, Vegatation Mgt, ECA, ICR
12	Great Plains Energy	FCA in Kansas (no FCA in Missouri), PCR, DSM
13	IDACORP, Inc.	FCA, RDM (Fixed Cost Adjustment Mechanism), DSM
14	NorthWestern Corp.	FCA, PGA, DSM, PCR, TAX
15	Otter Tail Corp.	FCA, FTY, DSM, ICR, TCR, ECA
16	PG&E Corp.	FCA, RDM, FTY, Nuclear Decommissioning, DSM, ECA
17	Portland General Elec.	FCA, RDM, FTY, ICR, DSM, SCR
18	Sempra Energy	FCA, PGA, RDM, FTY, ECA, DSM
19	Westar Energy	FCA, ECA, DSM

AMS--Advanced Metering System Recovery Rider

BDR -- Bad Debt Cost Recovery Rider

DSM -- Demand Side Management / Conservation / Energy Efficiency Adjustment Clause

ECA -- Environmental and/or Emissions Cost Adjustment Clause

FCA -- Fuel and/or Power Cost Adjustment Clause

FRP--Formula Rate Plan

FTY - Jurisdiction allows for future test year

ICR -- Infrastructure Investment / Renewables Cost Recovery Mechanism

PCR -- Pension Cost Recovery Mechanism

- PGA -- Gas Cost Adjustment Clause
- RDM -- Revenue Decoupling Mechanism
- SCR Storm Cost Recovery Tracker
- TAX--Property / Franchise Tax Recovery Mechanism
- TCR -- Transmission Cost Recovery Tracker

WNA -- Weather Normalization Adjustment or other mitigants
